Reporting Limit: 1% Gravimetrically Reduced Reporting Limit: 0.01% PLM analysis is based on Visual Estimation and NESHAP recommends that any friable sample with an asbestos content less than 10 percent be verified by Point Count or TEM Analysis. The EPA recommends that any attic loose fill vermiculite should be treated as asbestos containing material. This report must not be reproduced except in full with the approval of the laboratory. The test results apply to the sample as received.

Reporting Limit: 1% Gravimetrically Reduced Reporting Limit: 0.01% PLM analysis is based on Visual Estimation and NESHAP recommends that any friable sample with an asbestos content less than 10 percent be verified by Point Count or TEM Analysis. The EPA recommends that any attic loose fill vermiculite should be treated as asbestos containing material. This report must not be reproduced except in full with the approval of the laboratory. The test results apply to the sample as received.

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to the items as received and makes no statement as to the contents of surrounding materials. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to the items as received and makes no statement as to the contents of surrounding materials. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

RE: Nelson Park 455, 457, 459, 461

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to the items as received and makes no statement as to the contents of surrounding materials.. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to the items as received and makes no statement as to the contents of surrounding materials. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

RE: Nelson Park 2010 - A, B, C, D

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to the items as received and makes no statement as to the contents of surrounding materials.. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to the items as received and makes no statement as to the contents of surrounding materials. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to the items as received and makes no statement as to the contents of surrounding materials.. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to items tested and makes no statement as to the contents of surrounding materials and apply to the sample as received. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

RE: Nelson Park 2050,2052,2054,2056

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to items tested and makes no statement as to the contents of surrounding materials and apply to the sample as received. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to items tested and makes no statement as to the contents of surrounding materials and apply to the sample as received. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

RE: Nelson Park 2082 - A, B, C, D

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to the items as received and makes no statement as to the contents of surrounding materials.. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

RE: Nelson Park 2084 - A, B, C, D

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to the items as received and makes no statement as to the contents of surrounding materials.. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

RE: Nelson Park 2090 - 2092 - 2094 - 2096 All One Bldg.

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to the items as received and makes no statement as to the contents of surrounding materials.. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

RE: Nelson Park 2100 - A, B, C, D

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to the items as received and makes no statement as to the contents of surrounding materials.. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to the items as received and makes no statement as to the contents of surrounding materials.. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

RE: Nelson Park 2106, 2108, 2110, 2112 4 Unit Building

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to the items as received and makes no statement as to the contents of surrounding materials.. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

RE: Evaluation Specialist
Certification Number: ES34635
Expiration Date: 1/31/2024

Dear Mike Rombke:

This letter and enclosed certification card approves your request to be certified as an asbestos Evaluation Specialist. You must present your card upon request at any project site while performing duties. Copies of cards are not acceptable as proof of certification.

This certification may be revoked by the Director of the Ohio Environmental Protection Agency (EPA) for violation of any of the requirements of 3745-22 or 3745-20 of the Ohio Administrative Code.

If you have any questions, please contact the Asbestos Program at 614-644-0226 or by email at asbestoslicensing@epa.ohio.gov.

Sincerely,

Brandon M. Schwendeman

RE: Short-Term Confirmatory Radon Testing at:
Nelson Park Apartments
1994 Maryland Avenue
Columbus, Ohio 43219
Bureau Veritas Project No.: 156846.22R000-001.252

Dear Sir or Madam:

Bureau Veritas has completed Confirmatory Radon Testing for the above referenced property (the "Project"). Bureau Veritas previously detected elevated radon gas levels at the Project (BV Project No. 156846.22R000-001.173) dated June 2, 2022.

The sampling was performed according to the following protocol:

- Deployment of 93 short-term radon devices at the Project in an effort to measure radon gas concentrations. The devices were placed in accordance with applicable state and federal guidelines for short-term radon testing.

The United States Environmental Protection Agency (USEPA) uses a continuous exposure level of 4.0 pCi/L as an action level at which additional action is recommended. The screening technique utilized is designed to provide initial results that will identify whether further testing or investigation is required.

On September 23, 2022 and September 27, 2022, Bureau Veritas Project Manager Mr. Kurt Brickner (NRPP cert# 107585-RMP) placed the devices and retrieved the devices on September 27, 2022 and September 29, 2022.

The samples collected and the consolidated results of the two sampling events are listed in the Radon Sampling Table below.

Radon Sampling Table			
Sample Location	Result from May 24, 2022 – May 26, 2022 Testing (pCi/L)	Result from September 23 and 27, 2022 – September 27 and 29, 2022 Testing (pCi/L)	Average Results (pCi/L)

The average laboratory analysis results for radon gas concentration indicate that the samples collected from 1934 – Unit B, 1938 – Unit D, 1942 – Unit C, Main 1958 – Unit A, 1960 – Unit D, Main – 1966, 1978 – Unit D, 1982 – Units A and D, 1984 – Units A, B and C, 1984 – Units A, B, and C, 1986 – Units B and C, 2004 – Units A and C, 2006 – Units B and D, 2010 – Unit B, 2014 – D, Main – 2020, Main – 2022, 2036 – Units A and C, 2038 – Unit A, 2060 – Units B and C, 2040 – Unit D, Main – 2056, Main – 2064, 2066 – Unit D, 2078 – Units C and D, 2082 – Units A, B and D, 2084 – Units B, C and D, 2086 – Units A and D, Main – 2092, Main – 2094, Main – 2096, Main – 2054, 2100 – Units A and C, 2104 – Unit D, Main 2108, Main – 445, Main – 447, Main – 449, Main – 451 and Main – 461 are above the action level of 4.0 pCi/L as established by the USEPA. No keys were available to access 1978 – Unit A, 1962 – Unit D and 1984 – Unit D.

Bureau Veritas recommends the installation of radon gas mitigation systems in 1934 – Unit B, 1938 – Unit D, 1942 – Unit C, Main 1958 – Unit A, 1960 – Unit D, Main – 1966, 1978 – Unit D, 1982 – Units A and D, 1984 – Units A, B and C, 1984 – Units A, B, and C, 1986 – Units B and C, 2004 – Units A and C, 2006 – Units B and D, 2010 – Unit B, 2014 – D, Main – 2020, Main – 2022, 2036 – Units A and C, 2038 – Unit A, 2060 – Units B and C, 2040 – Unit D, Main – 2056, Main – 2064, 2066 – Unit D, 2078 – Units C and D, 2082 – Units A, B and D, 2084 – Units B, C and D, 2086 – Units A and D, Main – 2092, Main – 2094, Main – 2096, 2100 – Units A and C, 2104 – Unit D, Main 2108, Main – 445, Main – 447, Main – 449, Main – 451 and Main – 461; 1978 – Unit A, 1962 – Unit D and 1984 – Unit D – no keys to access. On average, one system mitigates one apartment unit or between 1,300 to 1,700 square feet of open building area. Radon mitigation systems require routine maintenance and upkeep, and typically the fans need replacing after approximately seven (7) years; therefore, the mitigation systems should be inspected on an annual basis (i.e., fans working properly). The cost to install a radon mitigation system may vary depending upon the size of the building/unit, interior design of the building/unit, the type of roofing system, type of soils and/or fill material beneath the building slab or building foundation, and depth to perched water and/or groundwater table.

There can be uncertainty with any radon measurement due to statistical variations, such as daily and seasonal fluctuations in radon concentrations, weather changes, operation of the HVAC system, and interference with closed house conditions.

The Project should be retested if any of the following occur:

- The property has a mitigation system installed (retest every two years);
- An addition is added to the property;
- An alteration is made that could change the ventilation pattern;
- Major cracks or penetrations occur in the foundation walls or slab;
- Significant nearby construction blasting or an earthquake occurs;
- Changes are made or happen to an installed mitigation system; or
- Occupation of a ground contact area that was not previously tested.

If you have any questions regarding this report, please contact me below at (800) 733-0660, Ext. 6455.

Sincerely,

Monica Graves-Thompson

SUMMARY OF RADON INSPECTION

Date: October 5, 2022

Client: Bureau Veritas
 10461 Mill Run Circle
 Suite 1100
 Owings Mills, MD 21117
Attn: Mrs. Monica Graves-Thompson

Site: Nelson Park Apts
 1994 Maryland Avenue
 Columbus, OH 43219

Project#: 156846.22R-001.252

TESTING OVERVIEW

On September 23 & 27, 2022, I placed 93 short term passive **charcoal** devices analyzed by Airchek, Inc, ODH Approval # RL10 via the EPA Method 402-R-92-004. The devices were retrieved on September 27 & 29, 2022.

Measurement Criteria: During a short-term test (2-90 days), to the extent reasonable, all windows, outside vents, and external doors should be kept closed (except for normal entering and exiting) during the testing period. In addition, for tests less than 4 days, closed-building conditions are required for 12 hours prior to the start of the test. Other than a furnace, fans ventilation systems, and air-cooling, systems that use outside air and exhaust inside air should not be operated. Operation of dryers, range hoods, and bathroom fans should be kept to a minimum.

Testing Protocols: The testing scope for this was to test the elevated units and units we were unable to get results for, 10% duplicates and 5% blanks. Residents were informed on the requirement to maintain closed housing conditions for the testing period.

The table below shows the locations and results for the testing.

Device #	Building#	Floor	Unit#	Location in Room	Start Date	Start Time	Stop Date	Stop Time	Results - pCi/L

Conclusion:

We were unable to access the following unit:

1. 1978-A - No Key

We were unable to retrieve the testers placed in the following units:

1. 1962-D - No Key For Reentry
2. 1984 - D - No Key For Reentry

We had the following 54 units come back with an average radon level above the 4.0 pCi/L threshold between the initial and retest:

1. 1934 - B - 4.6 pCi/L
2. 1938 - D - 11.8 pCi/L
3. 1942 - C - 5 pCi/L
4. Main - A - 4.3 pCi/L
5. 1960 - D - 4.5 pCi/L
6. Main - 1966 - 11.9 pCi/L
7. 1978 - D - 6.4 pCi/L
8. 1982 - A - 6.6 pCi/L
9. 1982 - D - 13.7 pCi/L
10. 1984 - A - 15.6 pCi/L
11. 1984 - B - 4.9 pCi/L
12. 1984 - C - 8 pCi/L
13. 1986 - C - 4.4 pCi/L
14. 1986 - B - 9 pCi/L
15. 2004 - A - 12.4 pCi/L
16. 2004 - C - 9.4 pCi/L
17. 2006 - B - 12.8 pCi/L
18. 2006 - D - 11.1 pCi/L
19. 2010 - B - 10.3 pCi/L
20. 2014 - D - 7.8 pCi/L
21. Main - 2020 - 8.5 pCi/L
22. Main - 2022 - 8.8 pCi/L
23. 2036 - A - 5.5 pCi/L
24. 2036 - C - 4.7 pCi/L
25. 2038 - A - 7.8 pCi/L
26. 2060 - B - 5.3 pCi/L
27. 2040 - D - 8.1 pCi/L
28. Main - 2056 - 13.2 pCi/L
29. 2060 - C - 11.1 pCi/L
30. Main - 2064 - 8.2 pCi/L
31. 2066 - D - 12.7 pCi/L
32. 2078 - C - 15.7 pCi/L

- 33. 2078 - D - 7.7 pCi/L
- 34. 2082 - A - 12.8 pCi/L
- 35. 2082 - B - 19.2 pCi/L
- 36. 2082 - D - 27.7 pCi/L
- 37. 2084 - A - 17.1 pCi/L
- 38. 2084 - B - 18.9 pCi/L
- 39. 2084 - C - 20.4 pCi/L
- 40. 2084 - D - 36.3 pCi/L
- 41. 2086 - A - 14.4 pCi/L
- 42. 2086 - B - 13.2 pCi/L
- 43. Main - 2092 - 9.7 pCi/L
- 44. Main - 2094 - 5 pCi/L
- 45. Main - 2096 - 8.4 pCi/L
- 46. 2100 - A - 11.6 pCi/L
- 47. 2100 - C - 11.4 pCi/L
- 48. 2104 - D - 5.1 pCi/L
- 49. Main - 2108 - 10.2 pCi/L
- 50. Main - 445 - 10.8 pCi/L
- 51. Main - 447 - 14.6 pCi/L
- 52. Main - 449 - 5.4 pCi/L
- 53. Main - 451 - 11.3 pCi/L
- 54. Main - 461 - 9.9 pCi/L

We recommend mitigation of the elevated and missing units.

All quality control measurements came in with acceptable results.

Sincerely,

Brickner, Kurt A.

SUMMARY OF RADON INSPECTION

Date: June 2, 2022

Client: Bureau Veritas
 10461 Mill Run Circle
 Suite 1100
 Owings Mills, MD 21117
Attn: Mrs. Monica Graves-Thompson

Site: Nelson Park Apts
 1994 Maryland Avenue
 Columbus, OH 43219

Project#: 156846.22R-001.173

TESTING OVERVIEW

On May 24, 2022, I placed 157 short term passive **charcoal** devices analyzed by Airchek, Inc, ODH Approval # RL10 via the EPA Method 402-R-92-004. The devices were retrieved on May 26, 2022.

Measurement Criteria: During a short-term test (2-90 days), to the extent reasonable, all windows, outside vents, and external doors should be kept closed (except for normal entering and exiting) during the testing period. In addition, for tests less than 4 days, closed-building conditions are required for 12 hours prior to the start of the test. Other than a furnace, fans ventilation systems, and air-cooling, systems that use outside air and exhaust inside air should not be operated. Operation of dryers, range hoods, and bathroom fans should be kept to a minimum.

Testing Protocols: The testing scope for this was to test 100% of the ground floor units, 10% of each additional floor, 10% duplicates and 5% blanks. Residents were informed on the requirement to maintain closed housing conditions for the testing period.

The table below shows the locations and results for the testing.

Device #	Building#	Floor	Unit#	Location in Room	Start Date	Start Time	Stop Date	Stop Time	Results - pCi/L
11149895	Main	1	1900	Living Area	5/24/2022	9:00 AM	5/26/2022	9:00 AM	< 0.3

19. 2094 - No Key For Reentry
20. 2096 - No Key For Reentry
21. 457 - No Key For Reentry

We had the following 33 units come back with an average radon level above the 4.0 pCi/L threshold:

1. 1934 - B - 4.7 pCi/L (4.4, 4.9)
2. 1938 - D - 11.5 pCi/L (11.3, 11.6)
3. 1958 - A - 4.2 pCi/L
4. 1978 - D - 5.2 pCi/L
5. 1982 - D - 5.2 pCi/L
6. 1982 - A - 4.7 pCi/L
7. 1984 - B - 5.5 pCi/L
8. 1984 - C - 5.6 pCi/L
9. 2014 - D - 11.2 pCi/L
10. Main - 2020 - 4.8 pCi/L
11. Main - 2022 - 5.9 pCi/L
12. 2032- C - 4.1 pCi/L
13. 2038 - A - 4.2 pCi/L
14. 2040 - D - 6.4 pCi/L
15. Main - 2056 - 10.2 pCi/L

16. 2054 - 9.2 pCi/L
17. 2078 - C - 11.6 pCi/L
18. 2078 - D - 4.7 pCi/L
19. 2082 - A - 6.3 pCi/L
20. 2082 - B - 24.3 pCi/L
21. 2084 - A - 18.3 pCi/L
22. Main - 2090 - 4 pCi/L
23. Main - 2092 - 8.5 pCi/L
24. 2100 - A - 7.8 pCi/L
25. 2100 - B - 4 pCi/L
26. 2100 - C - 8.7 pCi/L
27. 2104 - D - 4.3 pCi/L
28. Main - 2108 - 11.2 pCi/L
29. Main - 2112 - 5.4 pCi/L
30. Main - 445 - 12.4 pCi/L
31. Main - 447 - 16.9 pCi/L
32. 2104 - A - 4.5 pCi/L
33. Main - 461 - 12.7 pCi/L

We recommend retesting or mitigation of the elevated and missing units.

All quality control measurements came in with acceptable results.

Sincerely,

Brickner, Kurt A.

1. Certification

Bureau Veritas has completed a Lead-Based Paint Operations and Maintenance (O&M) Program report for the Nelson Park Apartments, which is located at 1994 Maryland Avenue in Columbus, Ohio. The O&M Program report was prepared at the Client's request utilizing methods and procedures consistent with good commercial or customary practice designed to conform to acceptable industry standards and applicable federal, state, and local regulations. Furthermore, the O&M Program preparer, listed below, is professionally trained, experienced, and qualified in accordance with industry and regulatory standards to complete this O&M Program report.

The independent conclusions represent Bureau Veritas' best professional judgment based on information and data available to us during the course of this assignment. Factual information regarding operations, conditions, and test data provided by the Client, owner, or their representative have been assumed to be correct and complete. Additionally, the conclusions presented are based on the conditions that existed and the information available at the time of the assignment.

Prepared by Bureau Veritas:

Deirdre F. Fontaine
Expanded Environmental Services Coordinator
Bureau Veritas

2. Introduction

This Operations and Maintenance (O&M) Program establishes policy for managing Lead-Based Paint (LBP) or Presumed/assumed LBP (PLBP) located at the Nelson Park Apartments (the "Project"). In a previous Phase I Environmental Site Assessment (ESA) (Bureau Veritas# 156846.22R000-001.129), Bureau Veritas described the property as follows:

- The Project, originally constructed in 1958, is currently developed as a multi-family residential community, comprised of 45 two-story buildings.

The purpose of this Program is to maintain LBP/PLBP surfaces in good condition. LBP/PLBP surfaces that are cracking, chipping, and peeling may represent an existing lead exposure hazard condition to building occupants or personnel. Repair and remediation of damaged paint surfaces, and maintenance activities that will potentially disturb LBP must be addressed by procedures that are beyond the scope of this O&M Program. Such remediation activities should be conducted by accredited and/or licensed lead-paint abatement contractor (See Section 4.5.). Nonetheless, the LPM should ensure that activities of lead-paint contractors follow applicable regulatory requirements and guidelines (See also Sections 4.1. and 5.).

This Program has been designed to protect the building occupants, visitors, custodial employees, maintenance personnel, and outside contractors, by maintaining the integrity of the painted surfaces. Specifically, this Program is designed to:

- 1) Control the creation of lead-contaminated dust;
- 2) Control the scattering (dispersion) of this dust; and
- 3) Minimize lead exposure to building occupants, workers, and contractors.

This Program will be in effect immediately and will remain in effect until all LBP has been removed from the facility.

This Program is limited to "operations and maintenance" activity at the Property; defined as routine work necessary to operate and maintain a building whether or not LBP is present. Hence, the O&M Program is designed to minimize LBP disturbance and lead exposure during routine building operations and maintenance procedures. The Program is not designed for LBP abatement activities that are conducted solely for the purpose of remediation of LBP hazards. Further differentiation between acceptable and unacceptable O&M activities is provided in Section 7.5. (O&M Worker General Procedures).

This O&M Program does not include all the necessary information to complete O&M activities that may disturb LBP. Work disturbing LBP requires detailed description of work practices and additional information regarding worker protection. All necessary additional information for completing such activities can be obtained through the training programs that must be completed by workers.

3. O&M Program Implementation Overview

This O&M Program is established with the intent of managing LBP/PLBP as follows:

1. Abate any existing LBP hazards utilizing a licensed LBP removal contractor.
2. LBP/PLBP in fair to good condition will be maintained in-place in its existing condition.
3. Establish procedures to minimize and/or avoid LBP/PLBP disturbance.
4. Contract lead paint removal activities prior to any maintenance/repair, renovation, or other activities that may cause a lead paint disturbance. [In-house lead paint abatement capabilities can be established. However, this is not within the scope of this O&M Program report. Guidance for in-house lead paint can be obtained upon O&M Worker training or can be provided by Bureau Veritas as a supplement to this O&M report.]

Listed below is a checklist of the programs and/or procedures that should be implemented as part of this O&M Program. These programs/procedures include immediate and on-going activities for proper management of LBP and PLBP at the Property. Upon implementation of the O&M Program, the Lead Program Manager (LPM) should be able to check off each of the activities listed within the **O&M Implementation Checklist**. Within the **O&M Implementation Checklist**, references are made to report section(s) which provide further description.

O&M IMPLEMENTATION CHECKLIST

The LPM should check that each of the activities/programs listed below has been completed or is implemented on an on-going basis.

- LPM Training** – Approximate two day EPA Accredited O&M training (Section 7.1.).
- Visual Reinspection of Property** by the LPM immediately after completion of O&M training (Section 7.2.).
- Initial Clean-Up, Abatement, and/or Testing** of known or potential lead paint hazards (Section 7.3.).
- Worker Training** (Section 7.1.).
- Maintenance and Custodial Personnel** – Awareness Training (2-Hour).
- Maintenance Personnel** – O&M Worker Training (approximately 13 to 16-Hour), if workers conduct work that could potentially disturb LBP.
- Employee, Tenant, and Contractor Notifications** (Section 7.4.).
- O&M General Procedures** (Section 7.5).
- Worker Protection Procedures** (Section 7.5.1.).
- Housekeeping Procedures** (Section 7.5.2.).
- Periodic Surveillance** procedures (Section 7.6.).
- Record Keeping** procedures (Section 7.7.).
- Work Control/Permit System** (Section 8.).

3.1. Statement of Intent

It is Management’s policy that deteriorated lead paint can be prevented at the Nelson Park Apartments by diligent upkeep of the structure. As part of this commitment, Management will use this Lead Paint O&M Plan as a guidance document to help maintain the Property in good repair.

3.2. Annual Review

It is the policy of Management to review this Lead Paint O&M Plan on an annual basis (at a minimum) and ensure that the plan is being adhered to. This O&M Plan cannot be modified without prior approval from the Property Owner or their representative.

This O&M Plan was last reviewed by:

4. O&M Personnel and Responsibilities

4.1. LBP O&M Program Lead Program Manager

Designation: The position of LBP O&M Program LPM at the Nelson Park Apartments is held by:

Qualifications: The O&M Program LPM should be properly qualified, through training and experience. The recommended level of training should include: health effects of lead exposure; identification of hazardous LBP conditions; LBP control methods; appropriate use of work practices for clean-up of lead dust; regulations controlling the handling of LBP; waste disposal information; and respiratory protection. An initial 13 to 16 hour supervisor training course followed by an annual approximate four-hour refresher training course is the recommended minimum training program.

Duties: The LPM is expected to become thoroughly familiar with the O&M Program contents. Going forward, the LPM is responsible for implementing and maintaining this O&M Program, and setting up and maintaining the record-keeping file. This Program and all other paperwork generated by the O&M Program must be kept on-site.

The LPM shall inform all maintenance personnel of the location of LBP, give them initial training and an annual refresher training on the elements of this O&M Program. The LPM shall inform the maintenance staff to report any potential LBP issues to him at once. The LPM also administers the O&M work control/permit system. This system is used to control work on those surfaces that contain or are suspected of containing LBP. No work is to be performed on LBP surfaces without written approval from the LPM. If any maintenance emergencies arise that may involve LBP, the LPM is to be contacted immediately.

The LPM is responsible for ensuring that no LBP is used on interior or exterior surfaces. The contracts should be reviewed to ensure contractors are not using LBP. Further, if paint stored at the Property is found to contain lead, it is the responsibility of the LPM to ensure that it is properly removed.

It is the responsibility of the LPM to assure that all outside contractors, that may encounter LBP, follow the provisions and procedures of this O&M Program. Furthermore, the LPM will only employ accredited and/or licensed lead-paint abatement contractors (See also Section 4.5.) for abatement projects. The LPM will affirm that any contractors/consultants that are engaged follow appropriate worker protection including respiratory protection, protective clothing, and hygiene facilities, and utilize environmentally protective practices including designation of regulated areas, use of safe housekeeping procedures, and posting of necessary signage. The LPM will confirm that all appropriate regulatory agency notification and personnel notifications have been completed. More detailed understanding of appropriate contractor work practices can be obtained in the various sections of this O&M report, and will also be obtained upon LPM training.

The LPM will ensure proper disposal of all waste generated.

The LPM will also perform regular surveys of the LBP treated surfaces, documenting conditions, assessing hazard potential and scheduling appropriate response actions.

4.2. Maintenance Staff

Qualifications: All maintenance personnel involved in maintenance activities that may encounter LBP should receive LBP training performed by a qualified training facility. Maintenance staff should receive at least a two to four hour LBP awareness training on an annual basis (described below in Section 4.3. and 7.1.). If job duties include potential disturbance of surfaces treated with LBP, a 13 to 16 hour training course followed by an annual approximate four-hour refresher training course is the recommended minimum training program. In addition, OSHA requires that workers be trained in the requirements of the OSHA lead standards. 29 CFR 1926.62 (1) (1) (i); and 29 CFR 1910.1025 (1)(1)(i).

Although the above described training programs are sufficient under most circumstances, specific state licensing or certification may be required in some locations.

Duties: Conduct LBP surveillance on a continuous basis as part of regular duties. Any damaged LBP applications should be reported to the LPM immediately and documented in the Program files.

Assist the LPM as necessary.

4.3. Custodial Staff

Qualifications: Custodial staff who will not be required to disturb LBP should receive awareness training in order to avoid exposure to lead hazards. This level of training should provide information about: where LBP is (or is assumed to be), the health effects of exposure, the plan being implemented by the building owner, and where records and information can be accessed. A two to four hour training course on an annual basis should meet this requirement. This training program may be performed by a qualified training facility or by properly trained in-house staff designated by the LPM.

Duties: Conduct LBP surveillance on a continuous basis as part of regular duties. Any damaged LBP should be reported to the LPM immediately and documented in the Program files.

Assist the LPM and maintenance staff as necessary.

4.4. LBP Consultant

Designation: Bureau Veritas has developed the Program and can conduct additional or more detailed investigations and assessments if necessary.

Duties: As part of an annual reinspection and Program update until all LBP has been removed from the facility (separately proposed), Bureau Veritas can review the success of Program implementation. As part of this update, Bureau Veritas will notify the Client of any changes in LBP conditions or changes in regulations which may affect the Program.

A third party consultant may (1) design large repair projects, (2) observe the work of repair contractors, (3) inform applicable employees of the presence of LBP prior to the repair work being performed, (4) conduct air monitoring or wipe-sampling before, during, and after repair projects, as appropriate, and (5) prepare and submit final repair project reports. The specification shall be site-specific and detailed for a particular project or operation. Specifications will be required for all major work by repair contractors, except for routine operations conducted under the guidance of the designated environmental consultant. Any removal of LBP where the primary purpose is hazard remediation (as opposed to the disturbance of small amounts of LBP for maintenance and repair), shall be conducted by contractors.

4.5. LBP Abatement Contractor

Qualifications: Abatement contractors and all workers that are utilized should be properly accredited, trained, licensed, and/or certified in accordance with all applicable state regulations.

Duties: Any contractor hired to perform activities at the facility within or beyond the extent of the Program shall follow the standards and procedures of the Program as well as applicable laws and regulations.

5. Regulations and Guidelines

As a brief overview, if an inspection for LBP is performed, federal regulations require that building occupants be notified of the lead-paint investigation and test findings. Other federal guidelines must be followed if work is undertaken which may disturb LBP or Presumed LBP at the Property. Furthermore, if elevated blood lead levels are identified in a child at the Property, investigation and testing requirements must be met as well as possible remediation requirements. Any LBP testing, survey, risk assessment, and/or remediation work that are undertaken should be conducted by properly trained and/or licensed personnel. Guidance contained within this O&M Program covers the requirements for notification and potential LBP disturbance activities; however, investigation and testing requirements in response to elevated blood lead cases is beyond the scope of this O&M Program and will be dictated by regulatory officials on a case-by-case basis.

The LBP regulations listed in this section shall be considered part of this Program. In the case of conflict between federal and state regulations, the more stringent regulations apply.

5.1. Occupational Safety and Health Administration

29 CFR 1910.1025	Lead Exposure in General Industry Standard
29 CFR 1926.62	Lead Exposure in Construction Standard
29 CFR 1910.134	General Industry Respiratory Protection Standard

5.2. Environmental Protection Agency

Resource Conservation and Recovery Act	Disposal of Lead-Based Paint Waste Recovery Act
Toxic Substances Control Act, Title IV	Model State Plan for Lead-Based Paint Activities Training and Certification

5.3. State of Ohio Lead Regulations

Ohio Adm. Code 3701 – 32 Lead Hazard Abatement and Inspection Activities	<p>Licensure of inspectors, contractors, risk assessors, project designers, and workers.</p> <p>Certification of training providers, clinical laboratories, abatement systems, and environmental lead analytical laboratories.</p> <p>Risk Assessor and Lead Inspector application content, qualifications, and standards of conduct.</p> <p>Recordkeeping and reporting requirements for clearance technician, lead inspectors, risk assessor, lead abatement contractor, and lead abatement project designers; all shall maintain a copy of each report issued for a lead activity for a period of 3 years and have documents accessible to Public Health Director. All shall submit a monthly summary of all addresses where lead inspections, sampling, risk assessments, lead hazard screen risk assessment, and other lead assessment activities and clearance examinations were performed.</p>
Ohio Rev. Code Title 37 § 4745 et seq.	<p>Clinical laboratories and physicians will be required to report the results of lead screening test to the department of health;</p> <p>Individuals involved in the lead inspection and abatement industry will be required to be licensed;</p> <p>The director of health or local boards of health may inspect structures for lead upon the report of an elevated blood lead level in a child; and</p> <p>Creates the Legislative Advisory Committee on Environmental Lead Abatement.</p>
Ohio Rev. Code Chapter 4745 et seq.	Standard license renewal procedure.

Ohio Rev. Code § 5301.30

Notification and disclosure during transfer or sale of residential real property.

6. Lead-Based Paint at the Property

LBP/PLBP has been assumed to be present as the result of Bureau Veritas' Phase I Environmental Site Assessment (ESA) of the Property. The buildings at the Property were originally constructed in 1958. Based on the age of the Property buildings, all painted surfaces with layers of paint pre-dating 1978 are presumed to contain layers of LBP. Therefore, all painted surfaces should be treated as LBP, unless testing proves that paint is not lead-based.

Representative drawings of doors, windows, walls, and stairs are presented in Appendix J "Building Systems".

The paint samples were collected as part of a screening approach only, and the methods and procedures used during the collection of the paint samples do not comply with *Requirements for Disclosure of Known Lead-Based Paint and/or Lead-Based Paint Hazards in Housing* (40 CFR part 745 and 24 CFR parts 35, 36, and 37).

Although the above paint chip sample was found to be non-LBP, based on the age of the Property buildings, all painted surfaces with layers of paint pre-dating 1978 are presumed to contain layers of LBP. Therefore, all painted surfaces should be treated as LBP, unless testing proves that paint is non lead-based.

Based on the findings of the Phase I ESA, all similarly painted surfaces at the Property should also be assumed to be treated with LBP, unless testing proves otherwise. Furthermore, all painted surfaces at the Property with layers of paint pre-dating 1978 should be assumed to contain layers of LBP, unless testing proves otherwise. Since Bureau Veritas' ESA did not include a comprehensive investigation and testing of all painted surfaces, LBP may be present on interior area, common area, and exterior surfaces that were not represented by the ESA sampling program.

As stated in Bureau Veritas' screening report, the painted surfaces were observed to be in good condition. Nonetheless, since Bureau Veritas' Screening did not include a comprehensive assessment of all painted surfaces, damaged painted surfaces may be present at the Property. Any damaged painted surfaces identified should be tested in an attempt to determine lead content. If any damaged painted surfaces are determined to be lead containing (above 0.50% by weight), these surfaces should be repaired, encapsulated and/or abated by a licensed contractor in accordance with all applicable regulations. Establishment of an O&M Program should include initial repair, covering, and/or removal of any damaged material.

7. O&M Program Implementation

7.1. Worker Training

Guidelines presented within this O&M Program are intended to minimize lead exposure both to workers and to the building occupants. Workers should not undertake any O&M tasks without having a basic understanding of the hazards of lead, the measures needed to protect themselves and others from lead exposure, and at least the minimum training required by law. The LPM should ensure that all O&M workers have received proper and required LBP training. Appendix F: contains a sample form that may be used to record worker training.

Lead Program Manager (LPM)

The LPM should be properly qualified, through training and experience. The recommended level of training should include: health effects of lead exposure; identification of hazardous LBP conditions; LBP control methods; appropriate use of work practices for clean-up of lead dust; regulations controlling the handling of LBP; waste disposal information; and respiratory protection. An initial 13 to 16 hour supervisor training course followed by an annual approximate four-hour refresher training course is the OSHA recommended training program for the LPM. This level of training is further described below as Level 3 training.

The LPM shall, at no cost to the employees, institute a training program for the following employees:

- Employees who perform repair and maintenance operations where LBP may be disturbed.
- Employees who perform maintenance, custodial, or housekeeping activities during which employees contact, but do not disturb, LBP or PLBP and activities to clean up dust, waste, and debris.

Training shall be provided prior to or at the time of initial assignment and at least annually thereafter. Recommended training programs for the various O&M personnel are further described below and in Section 4. (O&M Personnel and Responsibilities).

Level 1 - Awareness Training

Building workers who will not be required to disturb LBP should receive awareness training in order to avoid exposure to lead hazards.

This level of training should provide information about: where LBP is (or is assumed to be), the health effects of exposure, the plan being implemented by the building owner, and where records and information can be accessed. A two to four hour training course on an annual basis should meet this requirement. This training program may be performed by a qualified training company or by properly trained in-house staff designated by the LPM.

In addition, OSHA requires that workers be trained in the requirements of the OSHA lead standards: 29 CFR 1926.62 (1) (1) (i); and 29 CFR 1910.1025 (1)(1)(i).

Level 2 - Custodial Training

Workers whose tasks are custodial (e.g., sweeping, dusting and vacuuming of building surfaces), should receive:

- Awareness training,
- Training in appropriate work practices for clean-up of lead dust,
- Waste disposal information,
- Training in the use of respiratory protection,
- Further information on regulations controlling the handling of LBP.

Level 3 - Maintenance Training

Any custodial, maintenance, building service, or other worker who conducts tasks and activities that disturb LBP, should receive a level of training that includes all topics covered in the Awareness and Custodial levels, plus:

- LBP control methods,
- Work practices for conducting LBP control methods,
- Use of tools and associated products.

All maintenance personnel involved in maintenance activities that may encounter LBP should receive LBP training performed by a qualified training company. Maintenance staff should receive at least a two to four hour LBP awareness training on an annual basis. If job duties include potential disturbance of surfaces treated with LBP, a 13 to 16 hour training course followed by an annual approximate four-hour refresher training course is the recommended minimum training program. In addition, OSHA requires that workers be trained in the requirements of the OSHA lead standards: 29 CFR 1926.62 (1) (1) (i); and 29 CFR 1910.1025 (1)(1)(i).

7.2. Visual Reinspection

A visual reinspection of the Property should be conducted by the LPM or by properly trained O&M personnel immediately upon completion of the LPM training. One purpose of the reinspection is to identify all LBP, PLBP, or hazardous conditions that may have been overlooked during any previous Property inspections (Oversights may have occurred due to lack of training or understanding). The reinspection should be conducted utilizing the **LBP Inspection Form**, which is included in Appendix D:

Another purpose of the reinspection is to determine the need for **Notifications**. Based on the locations and conditions of LBP and PLBP present at the Property, notification activities may be recommended or required (see Section 7.4.).

All records of inspection, notifications, etc. should be maintained within the permanent O&M Program files.

7.3. Initial Clean-Up/Abatement/Testing

The LPM shall immediately address any damaged LBP/PLBP conditions identified during any initial inspections or reinspections. Actions taken by the LPM may be self directed or based on consultation with Bureau Veritas or other consulting personnel. Appropriate response actions may be limited to restricting access to affected areas of the Property to properly trained and/or protected personnel. Response actions may also include abatement (repair, removal, enclosure, etc.) of the conditions. Sampling of damaged materials may also be necessary prior to determination of appropriate response actions.

Damaged LBP/PLBP conditions or any other evidence of a lead dust release will be recorded on a Lead Dust Release Episode Report Form (Appendix G:). The form will be completed upon remediation of the condition.

All records of sampling, analysis, and abatement actions should be maintained within the permanent O&M Program files.

7.4. Notification

It is important to undertake an honest and open approach to the LBP notification procedure. People who are informed of the presence, location and condition of LBP in a building where they work, who understand that the mere presence of LBP is not necessarily hazardous to them, and who accept that LBP can often be managed effectively in place, can be very helpful to the owner in eliminating or reducing hysteria on the part of other less informed building occupants.

Residents and building occupants should be informed of the presence of LBP and hazards associated with it. In most instances it is the owner or lessor's responsibility to communicate this information to the lessee, not to the individual occupants. Appendix E contains a sample letter that may be used for this purpose. Occupants should understand the importance both of not disturbing LBP and of reporting the presence of chipping/flaking paint or visible dust and debris.

Notification either shall be in writing, or shall consist of a personal communication between the LPM and the person to whom notification must be given or their authorized representative. In either case, record of the notification shall be included in the Program files.

Regardless of the format, the following information should be included with the notifications:

- LBP has been identified in the building and is located in areas where the painted surfaces could be disturbed.
- The location and condition of the LBP, and the response that is appropriate for that condition.
- LBP only presents a health hazard when the paint is damaged, deteriorated, or chalking, or otherwise in a condition that microscopic dust or visible debris can be inhaled or ingested. The mere presence of LBP does not represent a health hazard.
- Do not disturb the LBP.
- Report any evidence of disturbance or damage of LBP to the LPM.
- Report any dust or debris that might come from the LBP or suspect LBP, any change in the condition of the LBP, or any improper action (relative to LBP) of building personnel to the LPM.
- Cleaning and maintenance personnel are taking special precautions during their work to properly clean up any LBP debris and to guard against disturbing LBP.
- All LBP is inspected periodically and additional measures will be taken if needed to protect the health of building occupants.

The LPM is responsible for ensuring that all notifications are conducted. Federal regulations stipulate that notifications will be conducted under specific circumstances as detailed in the table below and the text following the table:

Table of Federal Notification Requirements			
Notification Description	Notification Trigger	Notified Persons	Content Of Notification
Residential Tenant Notification	Upon Sale or Lease Renewal of Residential Property.	Purchaser or Lessee	Information regarding presence of known or PLBP.
Notification Prior to Renovation of Residential Properties (Within Residential Unit)	Preceding renovation activities	Apartment Tenant	Signed receipt of EPA Pamphlet.
(Building Common Area)	Preceding renovation activities	Tenants within apartments near work area (signed receipt of notification). Tenants of entire building (General Notice forms slipped under doors)	Signed receipt of EPA Pamphlet for tenants of nearby residential units. General scope and timing of work described on General Notice form.
Contractor Notification	Prior to conducting work for the Property that could disturb LBP	Contractor Representative	Information regarding presence of known or PLBP within the contractor's work area.

RESIDENTIAL TENANT NOTIFICATION (EPA - 40 CFR 745.100 through 119 - Disclosure of Known Lead-Based Paint and/or Lead-Based Paint hazards Upon Sale or Lease of Residential Property)

The building's residential occupants should be informed of the presence of LBP and associated hazards with it. It is the owner or lessor's responsibility to communicate this information to the lessee, not to the individual occupants. **Appendix E** contains a sample letter and example forms (Forms E and F) that may be used for this purpose. Occupants should understand the importance both of not disturbing LBP and of reporting the presence of chipping/flaking paint or visible dust and debris.

EPA regulations mandate that anyone buying or renting a pre-1978 residential Property be alerted to potential lead hazards in writing. This includes receiving the "Lead Hazard Information Pamphlet" developed by the EPA. No testing of the Property is required, but if testing has occurred in the past, the seller or lessor must reveal the results of the survey.

NOTIFICATION PRIOR TO RENOVATION [OF RESIDENTIAL PROPERTIES] (EPA - 40 CFR 745.326 – Pre-Renovation Notification: State and Indian Tribal Program Requirements)

Building occupants should be notified prior to the start of LBP O&M work or contractor LBP work affecting areas they use. Notification should be conducted prior to work that will disturb LBP/PLBP.

O&M personnel at each Property should ensure that either building staff or renovation contractors disseminate LBP hazard information pamphlets, at the time of renovation, to the residential tenant owner or lessee.

If renovation is within an individual residential unit, the notification should be given to the owner, lessee of that unit. The owner/lessee should be given an EPA pamphlet and asked to sign a form acknowledging receipt. Appendix E: contains sample notification forms (Forms A, B, C, and D) that may be used for this purpose.

If work is in a common area, the area should either be sealed off to public accessibility, or signs should be posted indicating where information pamphlets are available. Either the contractor or building maintenance staff should ensure that these procedures are undertaken. Pamphlets should be made available in a common area of the building or otherwise upon request to any building occupant; and general notice forms (Appendix E:, Form C) should be distributed to all of the building occupants. General notice forms should include information on the general nature, location, and start/end dates of LBP/PLBP disturbance work and can be slipped under the entrance door to each unit or equally distributed by other appropriate means. Records of all these notification activities should be maintained in the permanent Program files.

CONTRACTOR NOTIFICATION

Persons who use, occupy, or are affected by an area where LBP work will occur should be notified prior to the start of the work. OSHA regulations include mandatory notification of certain personnel prior to the performance of work regulated by OSHA. The LPM will notify the following persons of the presence and location of LBP at the work sites in their building and facilities:

- Prospective employers applying or bidding for work whose employees reasonably can be expected to work in or adjacent to areas containing LBP.
- Employees of the owner who will work in or adjacent to areas containing LBP.
- On multi-employer worksites, all employers of employees who will be performing work within or adjacent to areas containing LBP.
- Employers of employees (commercial tenants) who will occupy areas containing LBP.

7.5. O&M Worker General Procedures

7.5.1. Worker Protection

It is essential that all housing staff and others directly involved with preventing LBP exposures have instructions provided to them by qualified trainers to make them aware of proper procedures and work practices regarding LBP, and the need for protective equipment and proper hygiene. Great care must be exercised to protect workers from lead exposures and to prevent them from transporting lead dust to their homes on their clothing or belongings.

Personal hygiene is very important when conducting LBP O&M activities. Thorough face and hand washing should accompany any activity that may disturb the paint. Eating, drinking, and smoking should never be allowed in the work area.

O&M activities which may disturb LBP or Presumed/assumed LBP require various levels of personal protective equipment. However, as discussed in previous sections, guidance for activities which involve LBP disturbance is beyond the scope of this O&M Program and requires supplemental guidance documents. Nonetheless, a general overview of the personal protective procedures required for LBP disturbance activities is presented below.

To limit exposure to LBP dust, protective clothing such as disposable coveralls, gloves, and boots should be worn. When conducting projects that create significant airborne dust, half-face air purifying respirators equipped with high-efficiency particulate air (HEPA) filters are recommended and are required by OSHA when airborne exposures of lead reach a certain level.

Common sense must be used in selecting the worker protection appropriate for activities which may disturb LBP. Workers conducting O&M projects on LBP should wear the full protective gear recommended for the work.

Workers on projects with potential LBP exposure must not eat, drink, smoke, chew tobacco or gum, or apply cosmetics on the job. Hands and face must be washed before breaks and at the end of the work day. Breaks should be taken away from the work areas. Work clothes should not be worn home. Workers should wear protective work clothes instead of street clothes or they should wear protective garments over their street clothes. Work clothes should be disposed or laundered. If shower facilities are not available on-site or at the housing authorities maintenance shops, workers should shower and wash their hair immediately upon returning to their homes.

Activities related to preventive maintenance, such as normal repainting, and routine cleaning may be carried out with lesser protection, depending on the scale of the project and the potential for exposure. At the same time, it is important that workers understand the need for proper hand washing and personal hygiene when working with painted surfaces that may contain lead.

Workers engaged in other renovations or repair projects which may encounter LBP must be protected from exposures and must take the necessary precautions to control, contain, and clean up lead dust. The level of protection and controls will depend upon the scale of the project and its potential for dust generation. At one extreme, a light switch or a door handle can be replaced without great concern over lead dust generation. At another level, a kitchen renovation or window replacement project may create the potential for significant exposures. Regardless of the task, surrounding surfaces should be protected to capture any dust or paint chips generated during any work.

7.5.2. Housekeeping

Owners will continue to clean their building after learning that LBP is present. This section recommends a set of prudent cleaning procedures intended to minimize, or to prevent, the risk of exposure to accumulated lead-contaminated dust in residential and other buildings. Lead-contaminated dust can be generated by the friction of painted surfaces. Window sills, stools and troughs are likely areas for this type of lead-contaminated dust accumulation. Exterior lead-contaminated dust may also be tracked into and accumulate on and around entryways.

The recommended housekeeping procedure is periodic damp wiping or wet cleaning of areas such as those mentioned above. Horizontal surfaces (e.g., floors, stairs) where children play frequently should receive special attention.

Increased efficiency vacuum cleaner bags are advertised by many manufacturers for use with normal vacuum cleaners. Their use is recommended as a reasonably inexpensive precaution, for routine cleaning where no LBP chips or dust are present, though no scientific data currently exist to verify the manufacturer's advertising claims. If HEPA vacuum equipment is available, its periodic use for normal cleaning is strongly recommended.

Any cleaning or housekeeping activity that generates visible dust from chipping, flaking of known LBP should be stopped immediately. The conditions should be recorded on a Lead Dust Release Episode Report Form (Appendix G:). The form will be completed upon remediation of the chipping-flaking paint.

Some standard housekeeping practices are listed below along with specific methodologies that are recommended and not recommended.

Cleaning Floors

Recommended:

- Damp or wet mopping
- Standard "sponge" or "string" type mops and mild detergent
- Standard vacuum cleaners with increased efficiency vacuum cleaner bags if no visible dust or debris from LBP is present

Avoid:

- Mops with a "scrubber" strip attached
- Powered buffing or polishing equipment
- Vacuums with "beater bars" that may abrade the painted surface

Cleaning Carpets and Rugs

Recommended:

- "Wet scrubbing" methods to remove stains
- Steam cleaning methods
- Standard vacuum cleaners with increased efficiency vacuum cleaner bags if no visible dust or debris from LBP is present

Avoid:

- Dry sweeping of surface dust and debris
- Shaking or "beating" of carpets and rugs

Cleaning Walls

Recommended:

- Wet wipe wall completely with non-abrasive cloth
- Mild detergents

Avoid:

- Steel wool, scouring pads and granular cleaners
- Solvents that may dissolve paint

Cleaning Other LBP Surfaces

Recommended:

- Non-abrasive cloths and mild detergents

Avoid:

- Granular cleaners and scouring pads
- Solvent cleaners that may dissolve the paint
- Excessive rubbing of spots to remove them

Dusting

Recommended:

- Normal, non-abrasive dusting cloths or "dusters"

7.5.3. General Work Practices

To limit disturbance of lead-based paint dust and limit worker exposures, certain general work practices should be observed during all lead-paint disturbance operations. Although this O&M Program does not provide guidance for conducting lead-paint disturbance operations, the LPM can utilize the general work practices listed in this section to oversee the practices of lead-paint contractors.

The following engineering controls and work practices should be used in all operations that disturb LBP:

- Vacuum cleaners equipped with High-Efficiency Particulate Air (HEPA) filters to collect all debris and dust containing lead.
- Wet methods, or wetting agents, to control employee exposures during LBP handling, removal, cutting, and cleanup, except where employers demonstrate that the use of wet methods is infeasible due to the creation of electrical hazards, equipment malfunction, and, in roofing, slipping hazards.
- Prompt clean-up and disposal of wastes and debris contaminated with lead in leak-tight containers.

The following control methods should be used to achieve compliance with the Permissible Exposure Limits (PELs):

- Local exhaust ventilation equipped with HEPA filter dust collection systems.
- Enclosure or isolation of process producing lead dust.
- Ventilation of the regulated area to move contaminated air away from the breathing zone of employees and toward a filtration or collection device equipped with a HEPA filter.

The following work practices and engineering controls shall not be used for work that disturbs LBP:

- High-speed abrasive disc saws that are not equipped with point of cut ventilator or enclosures with HEPA filtered exhaust air.
- Compressed air used to remove LBP, unless the compressed air is used in conjunction with an enclosed ventilation system designed to capture the dust cloud created by the compressed air.
- Dry sweeping, shoveling or other dry clean-up of LBP dust and debris.
- Employee rotation as a means of reducing employee exposure to lead.
- Open flame burning or torching
- Uncontained hydro-blasting or high pressure washing
- Abrasive blasting or sandblasting without HEPA vacuum exhaust tools
- Use of heat guns
- Dry scraping
- Methylene chloride-based chemical strippers
- Demolition of plaster or gypsum walls or other LBP-contained components with sledge hammers or similar tools
- Welding on surfaces coated with LBP

7.6. Periodic Surveillance

Inspection of all LBP/PLBP in common and employee accessible areas should be conducted by the LPM or his designee upon implementation of this Program (as discussed in Section 7.2.) and at least once per year thereafter. In addition, Maintenance and Custodial Workers should be trained to conduct LBP surveillance on a constant basis within common area, employee areas, as well as within commercial and residential units while conducting their regular job duties at the Property. Any damaged LBP identified by Maintenance and Custodial personnel shall be brought to the immediate attention of the LPM.

Damaged LBP/PLBP conditions or any other evidence of a lead dust release will be recorded on a Lead Dust Release Episode Report Form (Appendix G:). The form will be completed upon remediation of the condition.

The LPM, utilizing the **LBP Inspection Form** (Appendix D:), should keep an accurate log of all the surfaces inspected. These inspections should be performed as part of routine maintenance. It should also be the intention of on-site management to inspect and inventory each apartment unit at the time of tenant turn over.

Any paint that is either assumed to be LBP or is proven by testing to be LBP shall be handled in accordance with the O&M Program. If any maintenance activities need to occur on these (assumed or positively tested) LBP surfaces, the activities should also be performed in accordance with the O&M Program.

The LPM shall schedule repair of damaged surfaces when necessary. The LPM will determine if the painted surface can be effectively maintained in the Operations and Maintenance Program, or if, based on the risk of lead exposure, removal, repair, encapsulation or enclosure is warranted. In the event that new damage is noted, a licensed contractor should be engaged to conduct any necessary LBP abatement. The LPM shall schedule repair of damaged material when necessary.

If the reinspection discovers no change in LBP/PLBP conditions and all painted surfaces are in good condition, then this too should be included in the annual report. This report should then become part of the building's permanent O&M Program file that should be kept for 40 years.

Any removal of LBP where the primary purpose is removal, as opposed to the disturbance of small amounts of LBP in order to access a building component, shall be considered LBP abatement. LBP abatement (removal, repair, encapsulation and enclosure) at the Property shall be accomplished by a qualified/trained LBP contractor. The LPM may contact the LBP consultant prior to initiating any LBP abatement work. Depending on the scope of work, detailed project specifications may be necessary to ensure satisfactory project completion. In addition, a Project Designer may be needed to design abatement activities that are beyond the scope of an O&M Program.

Painted surfaces can be tested to determine if LBP is present. If testing has not been performed, surfaces containing layers of paint pre-dating 1978 should be assumed to contain layers of LBP. The guidance in the O&M Program should be used when working on these surfaces.

There are two primary methods for testing paint for lead: X-ray fluorescence detectors (XRF) and laboratory analysis of paint chips. Secondary methods include using chemical kits for spot testing or chemical swabs, such as LeadCheck Swabs. The results of secondary testing methods are more reliable when laboratory testing of paint chips is used to verify the secondary method results. The most dependable way to test for a lead-paint dust hazard is wipe tests followed by laboratory analysis.

7.7. Record Keeping

Recordkeeping Required By This Program

All documentation required by this Program shall be stored in permanent files for the life of the facility and must be transferred to successive owners of the facility. Records shall be maintained for all activities involving LBP covered surfaces as well as PLBP covered surfaces and shall include: those records listed below, contractor and other personnel notifications as discussed in Section 7.4. , and all other documentation of Program compliance.

All documents related to the operations and maintenance of LBP in buildings should be maintained by the owner. These records include, but are not limited to: LBP survey and assessment reports; lead testing laboratory reports; and records of O&M work that has altered, enclosed, or removed LBP.

Building owners should keep employee records of workers assigned to specific LBP O&M work. This includes O&M worker training and LBP hazard awareness training. Certain records, such as air monitoring data and medical surveillance results, must be kept by the employer for specified periods of time, and these records should be maintained as outlined in the OSHA Lead Standards.

Manifests for regulated waste (see Appendix C:– Waste Tracking Form) must be kept for at least three years.

The O&M Program LPM is responsible for maintaining all records and documentation required in this O&M Program. Documentation may include, but is not necessarily limited to, the following:

- Annual LBP Inspection Forms (Appendix D:); any reinspection reports, and Documentation, to include photographs, and laboratory results when necessary
- Paint chip sampling data generated from routine or special surveys
- **Verification of Employee Training** (Appendix F:) and any other training records.
- **Job Request Forms** and **Maintenance Work Authorization Forms** (Appendix A: and Appendix B:) and any records for activities that may result in the airborne release of lead paint dusts
- **Waste Tracking Forms** (Appendix C:) for lead paint waste (e.g. clear track of records)
- All resident notifications (Appendix E:), resident responses and inquiries
- The Operations and Maintenance Program and up-dates thereto
- Documentation by means of a Log Book of all inquiries about locations of lead paint within the buildings or other aspects of the Operations and Maintenance Program
- Work Practices Used

- Respiratory Protection Program
- LBP Exposure/Incident Reports
- Air Monitoring Data
- Qualifications and Performance Records for Outside Contractors performing O&M work
- Data to rebut presumption that surfaces are painted with LBP.

For employees engaged in lead-related work, documentation includes the following:

- Personal Air Sampling/Exposure Monitoring Records *
- Medical Records (for employees subject to a medical surveillance program) *
- Employee Training Records
- Fit Test Records (for employees that use respirators) *

* Required for employees who are involved in LBP disturbance work.

If settled dust sampling is used it is advisable to maintain these records also.

Records generated by the above documentation system should be used to organize records for the O&M Program. These records shall be maintained by the LPM and kept on-site at all times.

It is the responsibility of the LPM to screen requests for information and determine if it is appropriate to release O&M information. The building owner(s) should make available all written elements of the O&M Program to the building's O&M staff as well as to tenants and building occupants, if applicable. Building owners are also encouraged to consult with their legal counsel concerning appropriate record keeping strategies as a standard part of their O&M programs.

OSHA requires that employers provide to each employee their record of exposure and medical surveillance (if applicable) under the Records Access Standard (29 CFR 1910.20). Note that state and local regulations may require that additional information be recorded and retained.

Training Records

All worker training must comply with federal, state and local requirements (see Section 7.1.) and should be documented in the O&M Program. Documentation requires placing copies of training certificates, class rosters, and course outlines in a section of the Program file. Training records should be maintained by that employer for one year beyond the last date of employment.

Inspection, Hazard Assessment and Abatement Records

All lead inspection or survey results should be part of the O&M Program. LBP chemical swab results, X-Ray Fluorescence (XRF) reports, laboratory analyses results, spot-testing results, field sheets, and field notes should be organized in a section of the document. Survey results should be easily accessible for reference. LBP surfaces should be visually inspected periodically depending on conditions. Section 6. (Lead-Based Paint at The Facility) should be updated when additional lead surveys are performed.

Lead inspections, hazard assessments, abatement records and any other information concerning the identification, location and condition of LBP shall be maintained by the LPM for the life of the facility and should be transferred to successive owners of the facility.

Objective Data

Objective data relied upon as part of an initial or negative exposure assessment must contain the following information. Note: an exposure assessment should not be necessary unless work is performed that can potentially disturb LBP.

- The painted surface type qualifying for exemption;
- The source of the objective data;
- The testing protocol, results of testing, and/or analysis of the paint for the release of lead;
- A description of the operation exempted and how the data support the exemption;
- Other data relevant to the operations, painted surfaces, processing, or employee exposures covered by the exemption.

Objective data records shall be maintained for the duration of the employer's reliance upon such objective data.

Exposure Assessment Records

Exposure assessment records must include the following information. Note: an exposure assessment should not be necessary unless work is performed that can potentially disturb LBP.

- The date of measurement;
- The operation involving exposure to lead that is being monitored;

- Sampling and analytical methods used and evidence of their accuracy;
- Number, duration, and results of samples taken;
- Type of protective devices worn, if any;
- Name, social security number, and exposure of the employees whose exposures are represented.

Exposure assessment records shall be maintained for at least 30 years.

Medical Surveillance Records

Medical surveillance records must include the following information. Note: Medical Surveillance of employees should not be necessary unless work is performed that can potentially disturb LBP.

- The name and social security number of the employee;
- A copy of the employee's medical examination results, including the medical history, questionnaire responses, results of any tests, and physician's recommendations;
- Physician's written opinions;
- Any employee medical complaints related to the exposure to lead;
- A copy of the information provided to the physician;

Medical surveillance records should be maintained for the duration of employment plus 30 years.

Transfer of Records

Lead inspections, hazard assessments, abatement records and any other information concerning the identification, location and condition of LBP shall be maintained by the LPM for the life of the facility and should be transferred to successive owners of the facility.

If the employer ceases to do business and there is no successor employer to receive and retain records for the prescribed period, the employer should notify the U.S. Department of Labor (DOL) at least 90 days prior to disposal and, upon request, transmit the records to the DOL.

8. Recommended O&M Work Control/Permit System

Introduction

The Work Control/Permit System described in this section is not designed to address all sizes and varieties of jobs that may cause potential lead-paint disturbance. The forms and procedures utilized in this section and in this O&M Program may be more burdensome than is necessary for smaller jobs, depending on the applications of LBP or PLBP that are present at the Property.

Determination of which forms and Work Control/Permit System to use will be Property and situation dependant. Guidelines for which forms and procedures to use for typical or emergency work requests should be made by the LPM at each Property. Subsequently, these guidelines should be outlined in interoffice correspondence or personnel training documents. Hence, the LPM can develop Property specific guidelines for the types of activities that require completion of O&M forms, and guidelines for which forms to use for different paint applications and situations. Therefore, the guidelines for O&M Program procedures at each Property can be made by the LPM, or through consultation with Bureau Veritas (separately contracted).

Work Control/Permit System

The O&M LPM or a designee should review O&M general procedures with all workers who will perform activities in the presence of LBP or PLBP. Workers should be notified to consult with the LPM or other designee if they have any questions, if any problems occur, if LBP/PLBP disturbance may occur, or if it appears to the workers that additional precautions might be necessary to safely perform their duties.

This section describes one suggested method of O&M work tracking and record keeping procedures utilizing the attached and appended checklists, figures, and forms. A checklist (Figure 1) is provided below to guide the LPM through necessary decisions and use of the appended tracking forms. A flowchart illustrating the typical decision scenarios and use of the appended forms is shown in Figure 2, which immediately follows Figure 1 in the O&M report text. The process of controlling, tracking, and record keeping for O&M work in order to minimize improper LBP disturbance can be achieved using forms contained in this O&M Program. Use of the forms contained in this O&M Program is summarized below. The numbered discussions presented below correspond to the numbers presented on the Figure 1 Checklist and the Figure 2 Flowchart.

(1) As part of maintenance and custodial personnel training, O&M personnel are informed of the locations and conditions of LBP and PLBP. Personnel are also informed of routine custodial activities that can be performed without pre-authorization from the LPM. Personnel are trained to recognize conditions that require review by the LPM prior to commencement of work. That is, the LPM sets guidelines for all other building personnel regarding work that can be performed without initiating the O&M Work Control/Permit System (completion of a **Job Request Form** initiates the System). The LPM also sets guidelines regarding the types of work or surface disturbances that require initiation of the System. Guidelines may be different for each Property, dependant on the variety of LBP/PLBP treated surfaces, as well as conditions present at each Property. Guidelines are set by the LPM for each Property.

A **Job Request Form** (Appendix A:) should be completed prior to maintenance work or other O&M activities, as the necessity for form completion is determined by the LPM and subsequently prescribed by the O&M Program. The **Job Request Form** should be initiated by maintenance or custodial personnel for work that could disturb LBP. If the required work has been performed in the past, it might not be necessary to complete a **LPM Checklist** for each O&M activity. Past checklists can be reused for the determination of procedures.

(2) Before commencing renovation, remodeling, demolition, repairs, or maintenance activities that may disturb LBP or PLBP, prudent inspection and investigation for the presence of LBP must transpire. This shall include but not be limited to inspection of this Property's O&M Program to identify previously surveyed and tested areas. The LPM should review building inspection information to determine whether or not all PLBP treated surfaces within the work area have been previously sampled and analyzed for lead content. The LPM may need to inspect the area in which work will occur to determine the painted surfaces that may be disturbed during the requested work. The LPM should initiate a **LPM Checklist** (Figure 1) and evaluate the work to be performed based upon the information on a completed **Job Request Form**, available survey and assessment data, and data on past O&M activities (if available). When reviewing data and completing the **LPM Checklist**, the following should be determined:

- Whether the job requested is actually a lead paint O&M activity.
- The types of LBP/PLBP treated surfaces that might be encountered during the work.
- Whether a LBP/PLBP disturbance is likely to occur.

All of the above information should be recorded on a **Maintenance Work Authorization Form** (Appendix B:). If the LPM determines that no LBP or PLBP treated surfaces are likely to be disturbed during the work described on the **Job Request Form**, the various forms are completed and signed, and the requested job is allowed to proceed.

- (3) If the LPM determines that LBP or PLBP will be potentially disturbed during the requested work, then work cannot proceed without further action. If all painted surfaces that will be potentially disturbed have been tested during previous investigations, and it is known which painted surfaces are treated with LBP and which surfaces are treated with non LBP, then the work can proceed without further investigation and/or testing; however, abatement of LBP surfaces may be necessary. The LPM should engage a licensed lead-paint abatement company to abate (remove, encapsulate, or enclose) the known LBP treated surfaces such that no LBP will be disturbed during the O&M work.
- (4) If upon inspection of the work area, a painted surface or area is identified which may be disturbed and has not been represented by previous survey and sampling efforts, then all such surfaces should either be tested by an accredited lead paint inspector, or be assumed to be treated with lead paint. The LPM shall employ the services of an environmental consultant or lab when the need for inspection and sampling services arises. An EPA accredited lead-paint inspector should be engaged to inspect the work area and sample any PLBP that could be disturbed by the work.
- (5) The inspector's findings and test results will dictate whether lead paint abatement must be conducted prior to the initiation of work. If the inspector's report concludes that all painted surfaces to be potentially disturbed are non-lead paint, the work described on the **Job Request Form** can proceed without further investigation or lead paint abatement. The LPM completes and signs the **Job Request Form, Maintenance Work Authorization Form, and LPM Checklist**.
- (6) If the inspector's report concludes that any of the painted surfaces to be potentially disturbed during the O&M work is/are treated with lead paint, then the LPM should engage an accredited lead-paint abatement company to abate (remove, encapsulate, or enclose) the known LBP treated surfaces such that no LBP will be disturbed during the O&M work. The LPM should ensure proper training of all contractors, verify that all Building Owner and tenant (if applicable) notifications are completed, and conduct building personnel notification for areas of the building that may be disrupted by the lead-paint abatement activities.

Depending on the scope of work, detailed project specifications may be necessary to ensure satisfactory project completion. In addition, engagement of an accredited Project Designer to design any abatement activities that are beyond the scope of an O&M Plan may be prudent.

The LPM should separately contract qualified/trained lead-paint monitoring personnel to conduct air sampling during the lead-paint abatement activities. Post abatement lead-dust sampling should also be conducted by the monitoring personnel in order to ensure that the work areas and surrounding areas are not contaminated by the lead-paint abatement work that was completed. The environmental monitoring company and the lead-paint abatement company should not be affiliated, so as to avoid any conflicts of interest.

- (7) The LPM or a designee should review work practices with the workers/contractors who will perform the work. Workers/contractors should be notified to consult with the LPM or designee if they have any questions during the lead paint work, if any problems occur, or if it appears to the workers that additional precautions might be necessary to safely perform the work.

Copies of all pertinent information should be provided to lead paint abatement contractors, including any lead-paint inspection/testing reports or laboratory results, or lead-paint abatement specifications, building occupant notifications, etc. Also, copies of information as listed on the **LPM Checklist** and **Maintenance Work Authorization Form** should be provided to the lead-paint abatement workers who will perform the lead paint work.

- (8) The LPM or a designee should review the activities of lead-paint abatement and environmental monitoring contractors during their work in order to protect the interests of the building owners and occupants.
- (9) Upon completion of any lead paint work, the LPM should ensure that final reports are received from all contractors, including waste manifests which indicate the final destination of all lead paint waste. This information should be attached to the **Waste Tracking Form** (Appendix C:). The LPM should complete the **Waste Tracking Form**. This form and all investigation, laboratory, lead-paint abatement, and environmental monitoring reports should be placed in the permanent O&M Program file.
- (10) Upon completion of lead paint abatement work, the LPM or a designee should inspect the work area to ensure that lead paint abatement work is complete and that O&M work can proceed without disturbance of any LBP or PLBP.
- (11) Once the LPM or designee has confirmed that no LBP will be disturbed by the O&M work described on the **Job Request Form**, the O&M work can proceed. All of the activities leading up to initiation of the O&M work (the above described steps) should be summarized on the **Maintenance Work Authorization Form**. This form, the **Job Request Form**, and the **LPM Checklist** should be completed, signed, dated, and placed in the permanent O&M Program files. Copies of pertinent information, as listed on the **LPM Checklist** should be provided to the O&M workers who will perform the actual O&M work.

Figure 1: LPM Checklist
(For O&M Work Control/Permit System)

- ____ (1) Receive and review **Job Request Form** (Appendix A)
 Work to be performed: _____

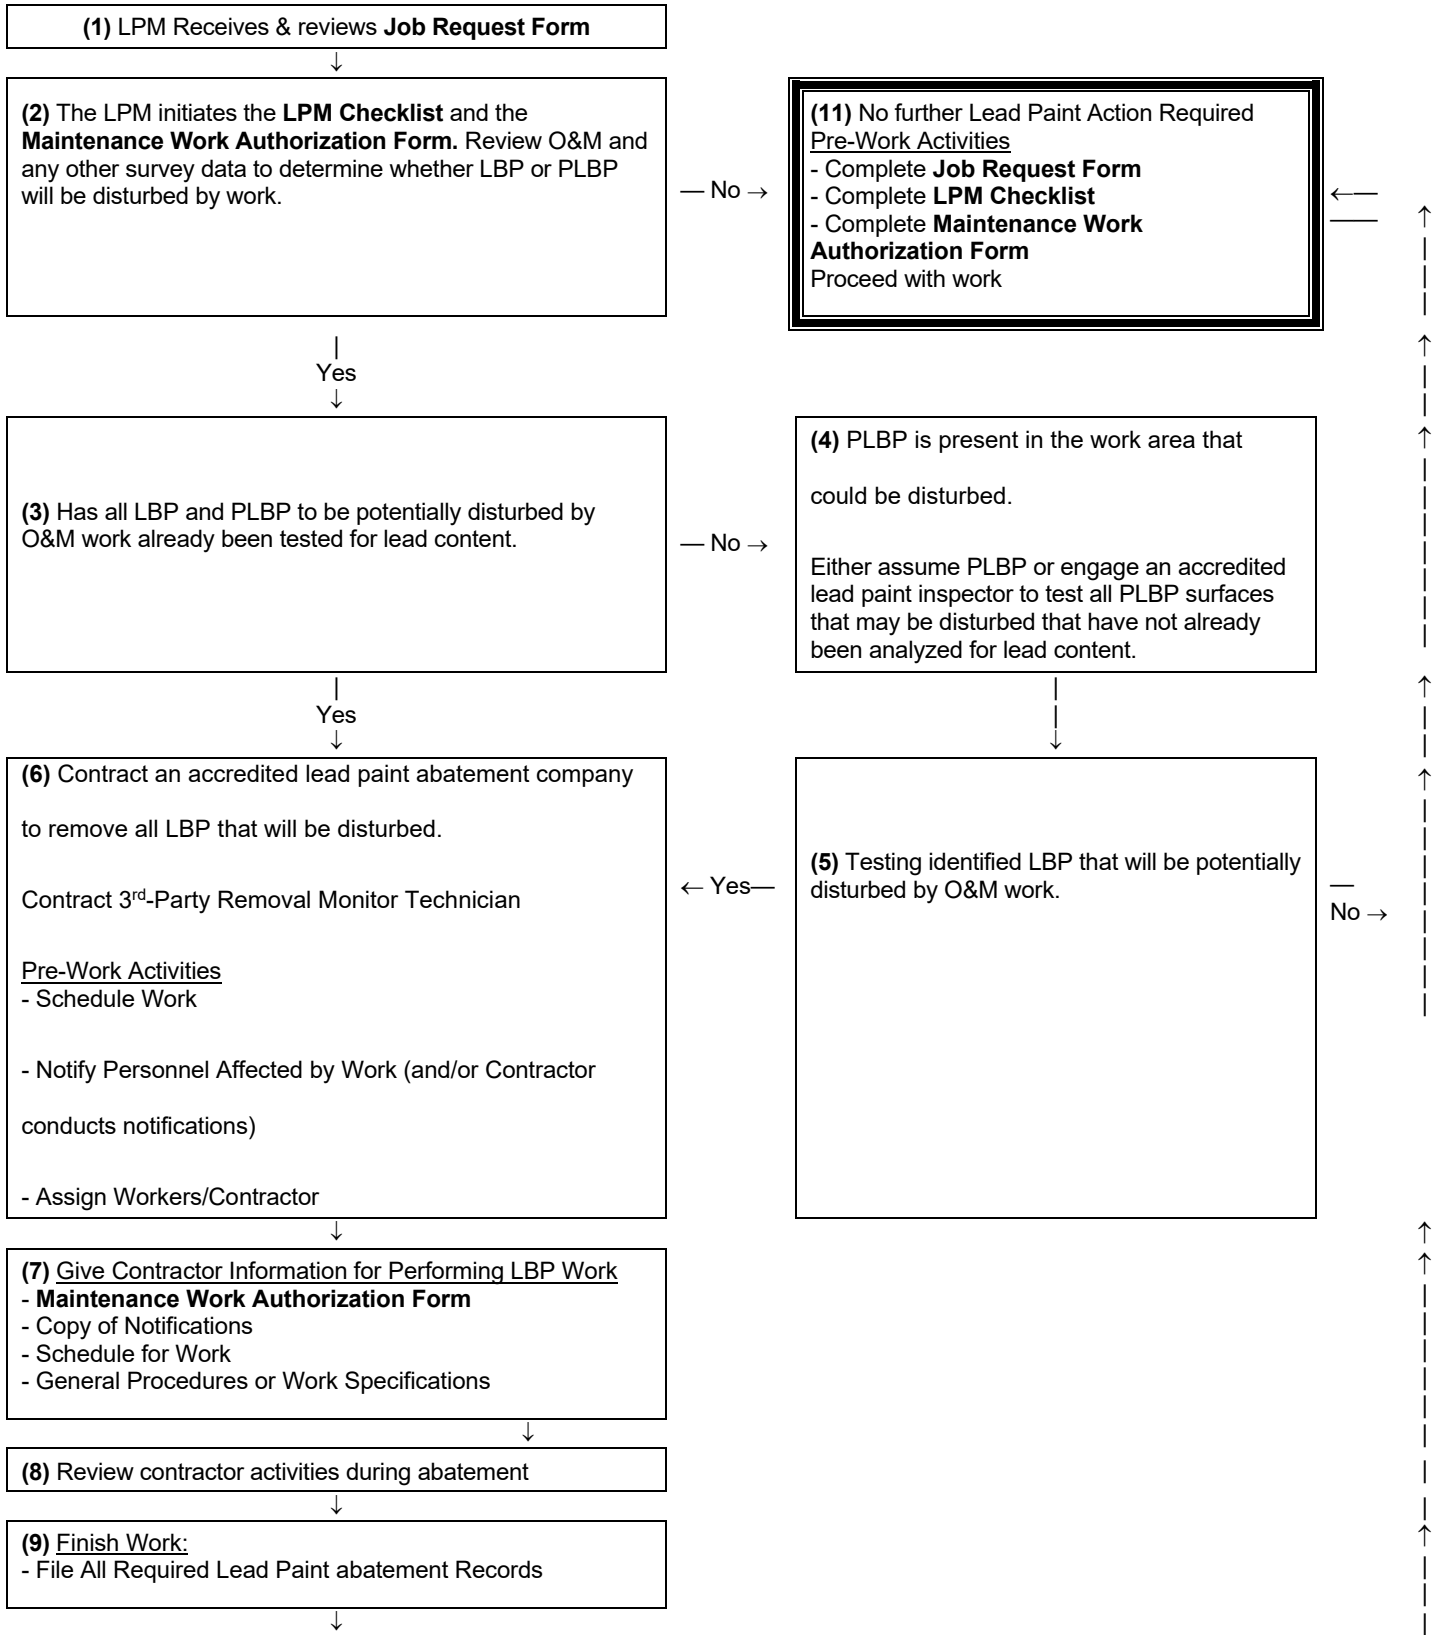

- ____ (2) Review or request survey data and inspect work area to determine whether LBP or PLBP will be potentially disturbed by the O&M work. If none will be disturbed, then the O&M work can proceed without further investigation - go to number (11) below.
- ____ (3) LBP or PLBP is present in the work area and may be disturbed by the O&M work.
 _____ All PLBP in the work area have been tested for lead content, and LBP is present that must be abated (repaired, removed, encapsulated, or enclosed) - go to number (6) below.
- ____ (4) Suspect LBP or PLBP is present that has not been tested for lead content.
- ____ (4) Either all Presumed LBP is assumed to be LBP, or an accredited lead inspector is engaged to survey the work area.
 _____ (5) The survey confirmed that no LBP will be disturbed by O&M work – go to number (11) below.
- ____ (5) PLBP is present, or the survey identified LBP that may potentially be disturbed by O&M work - go to number (6) below.
- ____ (6) Contract an accredited lead-paint abatement contractor to abate LBP/PLBP prior to initiation of O&M work.
 _____ (6) Schedule work when area is not in use or developed a plan to isolate area (if necessary).
- ____ (6) Contractor notifies building owner, affected tenants (as applicable); distributes pamphlets and otherwise makes pamphlets available as necessary.
- ____ (6) Building management personnel notify other personnel/employees affected by lead paint work.
- ____ (6) Verify currency and get copies of lead-paint abatement company’s licensure (if applicable).
- ____ (6) Engage a third party accredited air monitoring technician to monitor lead-paint abatement work and conduct post-abatement testing.
- ____ (7) Provide copies to workers/contractor of:
 _____ **Maintenance Work Authorization Form**
 _____ General Procedure(s) or abatement specifications
 _____ Schedule of work
- ____ (8) Work practices during lead-paint abatement work were acceptable.
- ____ (9) File all survey, lead-paint abatement, and abatement monitoring records in proper files.
- ____ (10) Reinspection of work area after abatement did not identify any LBP or PLBP.
- ____ (11) Completed forms filed in permanent O&M file.

Confirmation of Receipt of Lead Pamphlet

(Renovation within Dwelling Unit)

Apartment Owner Receipt of Pamphlet for Apartment Renovation

A “renovation” as defined by regulations promulgated by the Environmental Protection Agency (EPA) is scheduled to be performed in your dwelling unit. We are required to provide you with a pamphlet “Protect Your Family from Lead in Your Home” which is being given to you at this time. We are required to maintain records of the delivery of this pamphlet and request that you sign this receipt below.

Superintendent/Resident Manager

Date

I have received a copy of the pamphlet “*Protect Your Family From Lead in Your Home*” informing me of the potential risk of lead hazard exposure from renovation activity to be performed in my dwelling unit. I received this pamphlet before the work began.

Signature of Apartment Owner/Occupant

Printed Name of Apartment Owner/Occupant

Unit Address

Date

Note Regarding Mailing Option: As an alternative to delivery in person, you may mail the lead pamphlet to the owner and/or tenant. Pamphlet must be mailed at least seven days before renovation (Document with a certificate of mailing from the Post Office).

Confirmation of Receipt of Lead Pamphlet

(Renovation within Dwelling Unit)

Certification of Delivery of Lead Paint Pamphlet

I certify that I made a good faith effort to deliver the pamphlet "Protect Your Family From Lead in Your Home" to the unit listed below at the dates and times listed and [check (i) or (ii)]:

(i)

That an adult occupant was unavailable to sign the acknowledgement. I attempted to deliver the pamphlet on [insert dates and times].

- 1. _____
- 2. _____

I further certify that I left a copy of the pamphlet at the unit by sliding it under the door at the date and time indicated in #2 above.

(ii)

That an adult occupant refused to sign the acknowledgement. I further certify that I have left a copy of the pamphlet at the unit with the occupant.

Signature of Person Delivering Notice

Printed Name of Person Delivering Notice

Affiliation of Person Delivering Notice

Unit Address

Date of This Certification

Note Regarding Mailing Option: As an alternative to delivery in person, you may mail the lead pamphlet to the owner and/or tenant. Pamphlet must be mailed at least seven days before renovation (Document with a certificate of mailing from the Post Office).

Renovation Notice
(Renovations to Common Areas)

To All Residents:

We are writing to inform you that we will be performing renovations to common areas of the building. The work will begin on the start date and is expected to be completed by the completion date listed below. The renovations will be performed in the following areas: [describe areas]

Because this is an older building built before 1978, some of the paint disturbed during renovation may contain lead. You may receive a free copy of the pamphlet "Protect Your Family From Lead In Your Home" by:

- calling the managing agent at telephone number _____
- stopping the superintendent's workshop between the hours of _____
and _____
- describe other reasonable method.

Start Date

Anticipated Completion Date

APARTMENT CORP/CONDOMINIUM

By

Certification of Delivery of Notice of Common Area Renovations
(Renovations to Common Areas)

The undersigned, residing at _____, does hereby certify that on the date stated below I caused to be hand-delivered to each apartment in the building listed below a copy of the letter annexed to this certification, informing all residents about renovations to common area(s) of the building described in such letter. The letter states the date the work will begin and the date work is expected to be completed (a copy of the letter is attached). The letter also tells how to get the pamphlet "Protect Your Family from Lead in Your Home" free of charge.

Disclosure of Information on Lead-Based Paint (LBP) and/or LBP Hazards

Lead Warning Statement

Housing built before 1978 may contain LBP. Lead from paint, paint chips, and dust can pose health hazards if not managed properly. Lead exposure is especially harmful to young children and pregnant women. Before renting pre-1978 housing, lessors must disclose the presence of known LBP and/or LBP hazards in the dwelling. Lessees must also receive a federally approved pamphlet on lead poisoning prevention.

Lessor's Disclosure

(a) Presence of LBP and/or LBP hazards (check (i) or (ii) below):

(i) _____ Known LBP and/or LBP hazards are present in the housing (explain).

(ii) _____ Lessor has no knowledge of LBP and/or LBP hazards in the housing.

(b) Records and reports available to the lessor (check (i) or (ii) below):

(i) _____ Lessor has provided the lessee with all available records and reports pertaining to LBP and/or LBP hazards in the housing (list documents below).

(ii) _____ Lessor has no reports or records pertaining to LBP and/or LBP hazards in the housing.

Lessee's Acknowledgment (initial)

(c) _____ Lessee has received copies of all information listed above.

(d) _____ Lessee has received the pamphlet *Protect Your Family from Lead in Your Home*.

Agent's Acknowledgment (initial)

(e) _____ Agent has informed the lessor of the lessor's obligations under 42 U.S.C. 4852(d) and is aware of his/her responsibility to ensure compliance.

Certification of Accuracy

The following parties have reviewed the information above and certify, to the best of their knowledge, that the information they have provided is true and accurate.

Disclosure of Information on Lead-Based Paint (LBP) and/or LBP Hazards

Lead Warning Statement

Every purchaser of any interest in residential real property on which a residential dwelling was built prior to 1978 is notified that such property may present exposure to lead from LBP that may place young children at risk of developing lead poisoning.

Seller's Disclosure

(a) Presence of LBP and/or LBP hazards (check (i) or (ii) below):

(i) _____ Known LBP and/or LBP hazards are present in the housing (explain).

(ii) _____ Seller has no knowledge of LBP and/or LBP hazards in the housing.

(b) Records and reports available to the seller (check (i) or (ii) below):

(i) _____ Seller has provided the purchaser with all available records and reports pertaining to LBP and/or LBP hazards in the housing (list documents below).

(ii) _____ Seller has no reports or records pertaining to LBP and/or LBP hazards in the housing.

Purchaser's Acknowledgment (initial)

(c) _____ Purchaser has received copies of all information listed above.

(d) _____ Purchaser has received the pamphlet Protect Your Family from Lead in Your Home.

(e) Purchaser has (check (i) or (ii) below):

(i) _____ received a 10-day opportunity (or mutually agreed upon period) to conduct a risk assessment or inspection for the presence of LBP and/or LBP hazards; or

(ii) _____ waived the opportunity to conduct a risk assessment or inspection for the presence of LBP and/or LBP hazards.

Agent's Acknowledgment (initial)

(f) _____ Agent has informed the seller of the seller's obligations under 42 U.S.C. 4852(d) and is aware of his/her responsibility to ensure compliance.

Certification of Accuracy

The following parties have reviewed the information above and certify, to the best of their knowledge, that the information they have provided is true and accurate.

Lead-Based Paint Notice To Tenants Of:

Property Name: _____

Tenant: _____

In response to an environmental assessment that identified **Lead-Based Paint (LBP)** and/or **Presumed LBP (PLBP)** at the building(s), we have implemented a written LBP Operations and Maintenance (O&M) Program. This O&M Program is designed to maintain all LBP and PLBP in the building(s) in good condition and prevent conditions that could cause exposure to tenants and employees. Lead in paint only presents a health hazard when lead paint is ingested, which can occur when paint is chipping, peeling, or chalking or if lead paint is reduced to dust due to wearing on friction surfaces. The mere presence of LBP does not represent a health hazard. All LBP and PLBP is inspected periodically and additional measures will be taken if needed to protect the health of building occupants. Cleaning and maintenance personnel are taking special precautions during their work to properly clean up any debris, minimize disturbance of painted surfaces, and only undertake disturbance in a safe manner.

In accordance with our O&M Program, the building(s) has been inspected for damaged painted surfaces. PLBP are painted surfaces which contain layers of paint pre-dating 1978, and are assumed to contain elevated lead concentrations, greater than or equal to the EPA action level of 0.5 percent by weight. The building(s) at the Property was reportedly constructed in _____. Based on the age of the building(s), all painted surfaces with layers of paint pre-dating 1978 are presumed to contain layers of lead-based paint (LBP).

Tenants should note that the inspection of painted surfaces throughout the building(s) by a trained Lead Program Manager (LPM) did not identify any imminent tenant exposure conditions. That is, all of the painted surfaces were identified in generally good condition and are not expected to be disturbed by routine tenant operations. Furthermore, if disturbance must occur, safe procedures are being utilized. Therefore, the LBP identified in and around the tenant areas can be maintained in-place through the proper implementation of an O&M Program.

An O&M Program has been designed through consultation with experts in the field of lead detection and control to develop a course of action specifically designed to protect the health and safety of building occupants and the environment. A LBP O&M Program was established to provide an effective means for dealing with the lead paint. The objectives of the O&M plan are to:

- establish a program of procedures to maintain LBP in good condition
- ensure the safe clean-up of area(s) previously contaminated
- minimize disturbance and damage of LBP/PLBP
- develop in-house procedures to effectively handle emergency situations

Through the establishment of in-house lead response procedures and use of experienced outside lead abatement consultants, the lead paint within this facility can be controlled in a manner that will be safe to the health of the building occupants. Of course, the help and cooperation of all tenant agencies and occupants will be needed.

This office will implement a policy of providing informational updates on any activity that will involve the intentional disturbance of lead paint during building operations, emergency response to lead releases, and precautions and procedures designed to ensure the health and safety of the building occupants.

As part of the O&M Program, _____ is taking steps to notify the below listed persons of the presence of LBP and PLBP at the work sites in the building:

- Prospective employers applying or bidding for work whose employees reasonable can be expected to work in or adjacent to areas containing LBP or PLBP.
- Employees of the owner who will work in or adjacent to areas containing LBP or PLBP.
- All employers of employees who will be performing work within or adjacent to areas containing LBP or PLBP.
- Employers of employees (commercial tenants) who will occupy areas containing LBP or PLBP.

Also as part of the O&M Program, we ask that all building tenants participate in the following:

- Do not disturb painted surfaces.
- Report any evidence of disturbance or damage of painted surfaces to the LPM.

Appendix H: General Safety Considerations

General Safety Considerations

(This section is reprinted from Appendix D of the EPA's White Book for use by personnel performing O & M activities.)

Ronald L. Stanevich

NIOSH Division of Safety Research

This guide was primarily developed to provide recommendations concerning worker respiratory protection within the lead abatement industry. However, employers must not lose sight of the safety hazards their employees are exposed to in performance of their work. Lead abatement operations can take place in a variety of industrial, commercial and public settings. Each has unique potential safety hazards that the employer must control. However, nearly all abatement operations have some common safety hazards. With proper job planning and supervision, the employer can control both the health hazards and the safety hazards faced by their workers. The more common safety hazards associated with abatement operations and general recommendations to control them are discussed below. Sources for more specific safety information are listed to supplement and support the applicable OSHA regulatory standards.

I. Elevated Work Surfaces

The nature of lead abatement tasks usually requires workers to work from ladders, scaffolds, manlifts, or other elevated surfaces, which creates the potential for fall injuries. Slips and falls from ladders, scaffolds, and other elevated surfaces result in a major portion of the construction industry injuries. Many of these can be prevented by implementing a few control measures:

A. General

- (1) Avoid use of makeshift work platforms by providing portable ladders and scaffolds.
- (2) Ensure that job-built elevated work surfaces are inspected by a competent person other than the individual who erects it.
- (3) Avoid working from elevated surfaces where possible. Consider use of wands for spraying amended water or scrapers with extended handles.

B. Ladders

Eighty percent of ladder-related accidents result from improper use or application.

- (1) Workers should face the ladder when climbing up, down, or working from it.
- (2) Workers should not carry objects in their hands while ascending or descending ladders. While working from a ladder they should hold on with at least one hand.
- (3) Ladders should not be used as a substitute for planks, runways, or walkboards.
- (4) Ladders should be maintained in good condition. Defective ladders should be destroyed so that no one uses them by mistake.
- (5) Ladders should have safety feet in good condition to keep the ladder from slipping and cutting through polyethylene floor covers.
- (6) Ladder rungs/steps should be kept free of contaminants such as amended water and buildup of lead waste.
- (7) Employees should work no higher than the fourth step/rung from the top of the ladder.
- (8) Employees should not attempt to "reach" distant objects from a ladder; other platforms should be used.
- (9) Wood or fiberglass ladders should be provided to help control exposure to electrical hazards.
- (10) Employees should not straddle the space between a ladder and another object.
- (11) Employees should make a visual inspection of ladders before each shift.

C. Scaffolds

Falls from scaffolds result in about 2,000 injuries per month in the United States. These can be reduced by

- (1) providing guardrails around the perimeter of the work surface regardless of scaffold height
- (2) securing scaffold decks against slippage
- (3) keeping scaffold uprights vertical and pinned together when stacked
- (4) ensuring vertical members are braced to keep the scaffold plumb and level
- (5) decking the entire top portion of the work surface in lieu of using minimum planking dimensions
- (6) extending planks at least 6" (150 mm) over their support and cleating or restraining them from movement
- (7) ensuring that manufacturer built-in ladders are in good condition
- (8) maintaining mobile scaffold casters in good condition with position locking devices secured when employees are working from the scaffold
- (9) keeping mobile scaffolding height less than four times the minimum base dimension and with adequate cross-bracing
- (10) never interchanging scaffolding pans from different units
- (11) never using defective scaffolding
- (12) designating only "Competent" persons to perform scaffolding repairs.

II. Electrical Hazards

Lead abatement is often related to renovation or remodeling activities. Normally the equipment, machinery, overhead lighting fixtures, and auxiliary furnishings are removed to facilitate the abatement work. However, it is becoming more common that industrial and commercial buildings remain partially occupied while abatement operations are performed. In either situation, the abatement operator must take positive actions to protect employees from accidentally coming into contact with energized electrical circuits.

A. General

- (1) Perform a pre-work walk-through of the abatement area to look for pre-existing electrical hazards involved with the work.
- (2) De-energize as many circuits as possible.
- (3) Verify that the circuits have been de-energized with a "Field Current Sensing Device" circuit tester. Either lock out/tag out all de-energized circuits to prevent them from accidentally being energized.
- (4) Use non-conductive tools such as scrapers and vacuum attachments made of wood, plastic, or rubber.
- (5) Provide workers with non-conductive rubber boots and/or gloves when work must be done around energized wiring or equipment.
- (6) Prohibit accumulation of puddles of water on the floor. Workers should be trained in the intelligent use of amended water. No water should be used around energized circuits.

B. Permanent Building Circuitry

- (1) Ensure that all permanent circuits are provided with a grounding system. This can be determined with a portable ground tester.
- (2) Ensure that electrical outlets are tightly sealed and taped to avoid water spray.
- (3) Determine what equipment must remain energized during the abatement process.
- (4) Insulate or guard energized equipment and Wiring from employee contact and other conductive objects.
- (5) Avoid damaging permanent building wiring during the work.
- (6) Consider dry removal methods in the vicinity of electrical equipment which must remain energized.

C. Temporary Power

- (1) All temporary circuits provided by the abatement operator must be provided with a grounding system and protected by ground fault circuit interrupters.
- (2) Avoid stringing temporary wiring across floors
- (3) Elevated wiring should not be fastened with staples, nails, or wire.
- (4) Use care not to damage the wiring insulation during Installation or abatement work.

D. Electrical Cords and Tools

- (1) Provide extension cords that have a ground conductor.
- (2) Ensure that cords are not damaged, contain no splices. and that the grounding lug on the male plug is intact.
- (3) Position extension cords to eliminate stumbling/tripping hazards and to protect them from damage by moving scaffolds.
- (4) Provide electrical tools that are either grounded or of the double-insulated type
- (5) Use shatterproof, guarded bulbs and heavy duty wiring for temporary lighting.
- (6) Where plugs enter receptacles, ensure that the connection is protected by use of duct tape or by other means.

Data Sheet #515

National Safety Council

444 North Michigan Avenue

Chicago, Illinois 60611

III. Housekeeping

Lead abatement operations present continuous housekeeping problems. The accumulation of lead and other debris on polyethylene-covered floors create employee slipping and tripping hazards. It is essential that accumulation of such debris be bagged and removed from the floor as soon as possible. Even though this activity may initially require more effort, it will make final cleanup easier and the work area safer.

Additional information source:

Supervisors Safety Manual

National Safety Council

444 North Michigan Avenue

Chicago, Illinois 60611

IV. Emergency Planning

The abatement operator should develop emergency procedures for fires or severely injured employees. Since abatement work areas must be sealed off, thereby blocking normal exits, the operator must familiarize the workers with procedures for safe exit in case of fire. Furthermore, the operator should develop plans for obtaining emergency aid in case of severe employee injury. The plans should be compatible with decontamination procedures yet provide for quick medical aid.

Georgia Tech Research Institute

Georgia Institute of Technology

Atlanta, Georgia 30332

Appendix I: Glossary

AAAL: American Association for Laboratory Accreditation. Also known as A2LA.

Abatement: A measure designed to permanently eliminate lead-based paint hazards according to standards established by the Environmental Protection Agency (EPA) Administrator, pursuant to Title IV of the Toxic Substances Control Act (TSCA). Abatement strategies include the removal of lead-based paint, its enclosure, its encapsulation with a product shown to meet established or recognized standards pursuant to Title IV of TSCA, replacement of building components coated by lead-based paint, removal of lead-contaminated dust, and removal of lead-contaminated soil or overlaying of a durable covering—not grass or sod, which are considered interim control measures—on top of the soil, as well as preparation, cleanup, disposal, post-abatement clearance testing, recordkeeping, and, if applicable, monitoring.

Abrasion resistance: Resistance of the paint to being worn away by rubbing or being exposed to friction; related to both toughness and gloss.

Accessible surface: Any interior or exterior surface such as sills and protruding surfaces that a young child can mouth or chew.

Accreditation: A formal recognition that an organization, such as a laboratory, is competent to carry out specific tasks or types of tests.

Accredited laboratory: A laboratory that has been evaluated and approved by an accrediting body, such as the National Lead Laboratory Accreditation Program, to perform a specified measurement or task, usually for a specific property or material to be analyzed and for a specified period of time.

Accredited training provider: A training provider that meets the standards established by EPA to train risk assessors, inspector technicians, lead-based paint hazard control contractors, and workers.

Accuracy: The degree of agreement between an observed value and an accepted reference value; a data quality indicator. Accuracy includes a combination of random errors (precision) and systematic errors (bias) due to sampling and analysis.

Acrylic: A synthetic resin used in high-performance waterborne coatings; a coating whose binder contains acrylic resins.

Adhesion: The ability of dry paint or other coating to attach to a surface and remain fixed on it without blistering, flaking, cracking, or being susceptible to removal by tape.

Administrative removal: The temporary removal of workers before the concentration of lead in their blood reaches levels that require medical removal.

AIHA: American Industrial Hygiene Association.

ALC: See **Apparent Lead Concentration**.

Aliquot: See **Subsample**.

Alkali: A chemical, such as lye, soda, lime, and so on, that will neutralize an acid. Oil paint films can be destroyed by alkalis.

Alkyd: Synthetic resin modified with oil; coating that contains alkyd resins in the binder.

Apparent Lead Concentration (ALC): The average of three or more x-ray fluorescence (XRF) single cycle readings (nominal assay time of 15 to 25 seconds) on a *painted* surface. See **XRF analyzer**.

Bare soil: Soil not covered with grass, sod, or some other similar vegetation. Bare soil includes sand (for example, the sand in sandboxes).

Base substrate: The building material beneath the lead-based paint film. The material may be plaster, wood, brick, or metal.

Bias: A systematic error in the measurement process. For x-ray fluorescence readings, one source of bias is the substrate effect. See **Substrate effect**.

Biennial report: A report, EPA Form 8700–13A, submitted by generators of hazardous waste to the EPA Regional Administrator. The report is due on March 1 of even-numbered years. The report includes information on the generator's activities during the previous calendar year. The owner or operator of a treatment, storage, and disposal facility must also prepare and submit a biennial report using EPA Form 8700–1313.

Binder: Solid ingredients in a coating that hold the pigment particles in suspension and bind them to the substrate. Binders used in paints and coatings include oil, alkyd, acrylic, latex, and epoxy. The nature and amount of binder determine many of the coating's performance properties—washability, toughness, adhesion, gloss, and so on. See also **Pigment**.

Biological monitoring: The analysis of blood, urine, or both to determine the level of lead contamination in the body. Blood lead levels are expressed in micrograms of lead per one-tenth of a liter of blood (a deciliter), or $\mu\text{g/dL}$.

Blank: A nonexposed sample of the medium used for testing, such as a wipe or filter, and analyzed like other samples to determine whether the medium is contaminated with lead before samples are collected (for example, at the factory or the testing site) or whether the samples are contaminated after collection (for example, during transportation to the laboratory or in the laboratory).

Blind sample: A subsample submitted for analysis with a composition and identity known to the submitter but not to the analyst and used to test the analyst's or laboratory's proficiency in conducting measurements.

Building component: Any part of a building coated with paint.

Building component replacement: See **Replacement**.

Cementitious material: A material that is mixed with water, either with or without aggregate, to provide the plasticity, cohesion, and adhesion necessary for the placement and formation of a rigid mass (ASTM Standard C 11).

Certification: The process of testing and evaluating against specifications, the competence of a person, organization, or some other entity in performing a function or service, usually for a specified period of time.

Certified: The designation for contractors who have completed training and other requirements to allow them to safely undertake risk assessments, inspections, and abatement work. Risk assessors, lead-based paint inspectors, and abatement contractors should be certified by the appropriate State or Federal agency.

Certified Industrial Hygienist (CIH): A person certified by the American Board of Industrial Hygiene, who has at least 4 years' industrial hygiene experience and a graduate degree or 5 years' experience and who has passed a 2-day board examination. See also **Industrial hygienist**.

Certified Reference Material (CRM): Reference material that has at least one of its property values established by a technically valid procedure and is accompanied by or traceable to a certificate or other documentation issued by a certifying body.

CFR: See **Code of Federal Regulations**.

Chalking: The photo-oxidation of paint binders—usually due to weathering—that causes a powder to form on the film surface.

Characteristics: EPA has identified four characteristics of hazardous waste: ignitability, corrosivity, reactivity, and toxicity (as determined by the TCLP Test). Any solid waste that exhibits at least one of these characteristics may be classified as hazardous under the Resource Conservation and Recovery Act, depending on how the waste is produced and what quantities are generated.

Chewable surface: See **Chewed surface**.

Chewed surface: Any painted surface that shows evidence of having been chewed or mouthed by a young child. A chewed surface is usually a protruding, horizontal part of a building, such as an interior window sill.

CLC: See **Corrected Lead Concentration**.

Cleaning: The process of using a HEPA vacuum and wet cleaning agents to remove leaded dust; the process includes the removal of bulk debris from the work area. OSHA prohibits the use of compressed air to blow lead-contaminated dust off a surface.

Clearance examination: Visual examination and collection of environmental samples by an inspector technician or risk assessor and analysis by an accredited laboratory upon completion of an abatement project, interim control intervention, or maintenance job that disturbs lead-based paint (or paint suspected of being lead-based paint). The examination is done to assure that lead exposure levels do not exceed standards established by the EPA Administrator pursuant to Title IV of the Toxic Substances Control Act and that any cleaning following such work adequately meets those standards.

Clearance examiner: A person who conducts clearance examinations following lead-based paint hazard control and cleanup work.

Code of Federal Regulations (CFR): The codification of the regulations of various Federal agencies. The regulations are published in the Federal Register.

Cohesion: Ability of a substance to adhere to itself; internal adhesion; the force holding a substance together.

Common area: A room or area that is accessible to all residents in a community (for example, a hallway or a lobby); in general, any area not kept locked.

Competent person: As defined in the OSHA Lead Construction Standard (29 CFR 1926.62), a person who is capable of identifying or predicting hazardous working conditions and work areas, and who has authorization to take prompt, corrective measures to eliminate the hazards. A competent person is not necessarily a risk assessor, inspector technician, or abatement project supervisor.

Complete abatement: Removal or enclosure of lead-based paint in a dwelling and reduction of any lead-contaminated dust or soil hazards. See **Abatement**.

Compliance plan: A document that describes the tasks, workers, protective measures, and tools and other materials that may be used in lead-based paint hazard control to comply with the OSHA Lead in Construction Standard.

Containment: A process to protect workers and the environment by controlling exposures to lead-contaminated dust and debris created during abatement. See **Worksite preparation level**.

Contingency plan: A document that describes an organized, planned, and coordinated course of action during an event that could threaten human health or the environment, such as a fire, explosion, or release of hazardous waste or its constituents from a treatment, storage, or disposal facility.

Contractor: Any business entity, public body, or person performing the actual work on a lead-based paint hazard control project.

Corrected Lead Concentration (CLC): The absolute difference between the Apparent Lead Concentration and the Substrate Equivalent Lead.

Detection limit: The minimum amount of a substance that can be reliably measured by a particular method.

Deteriorated lead-based paint: Interior or exterior lead-based paint that is peeling, chipping, blistering, flaking, worn, chalking, alligating, cracking, or otherwise becoming separated from the substrate, or lead-based paint on a damaged or deteriorated surface or fixture.

Digestion blank: A mixture of the reagents used for digesting of paint, soil, or dust matrixes but without the matrix. The blank undergoes all the steps of the analysis, starting with digestion. The blank is used to evaluate the contamination process from a laboratory.

Direct-reading XRF: An analyzer that provides the operator with a display of lead concentrations calculated from the lead "K" x-ray intensity without a graphic of the spectrum. See **XRF analyzer**.

Disposal: The discharge, deposit, injection, dumping, spilling, leaking, or placement of solid or hazardous waste on land or in water so that none of its constituents can pollute the environment by being emitted into the air or discharged into a body of water, including groundwater.

Disposal facility: A facility or part of one in which hazardous waste is placed on land or in water to remain there after the facility closes.

Door mat: See walk-off mat.

Dust removal: A form of interim control that involves initial cleaning intervention followed by periodic monitoring and recleaning, as needed. Depending on the degree of lead-based paint hazards, dust removal may be the primary activity or just one element of a broader effort that addresses lead-based paint hazards.

Dust trap: A surface, component, or furnishing in a house that serves as a reservoir where dust can accumulate.

EBL: See **Elevated Blood Lead level**.

Efflorescence: The salt rising to the surface of a material, which is caused by the movement of water through materials, typically masonry, plaster, or cement. Paint or encapsulants may not adhere to a surface contaminated with efflorescence.

Elastomeric: A group of pliable, elastic liquid encapsulant coatings. An elastomer is a macromolecular material which, at room temperature, is capable of substantially recovering its size and shape after the force that causes the deformation is removed (ASTM D 907, D-14).

Elevated Blood Lead level (EBL): In children, any blood lead level greater than 10 µg/DL; in adults, any blood lead level greater than 25 µg/dL, as determined by the U.S. Centers for Disease Control and Prevention.

ELLAP: See Environmental Lead Laboratory Accreditation Program.

ELPAT: See Environmental Lead Proficiency Analytical Testing Program.

Encapsulation: Any covering or coating that acts as a barrier between the lead-based paint and the environment and that relies on adhesion and the integrity of the existing bonds between paint layers and between the paint and the substrate for its durability. See also **Enclosure**.

Enclosure: The use of rigid, durable construction materials that are mechanically fastened to the substrate in order to act as a barrier between the lead-based paint and the environment.

Engineering controls: Measures other than respiratory protection or administrative control that are implemented at the work site to contain, control, and/or otherwise reduce exposure to lead-contaminated dust and debris. The measures include process and product substitution, isolation, and ventilation.

Environmental Lead Proficiency Analytical Testing Program (ELPAT): Is a proficiency testing program administered by the AIHA with assistance from the National Institute of Occupational Safety and Health (NIOSH). All laboratories accredited under NLLAP must participate in a proficiency testing program to the ELPAT program is designed to test a laboratory's on-going proficiency in analyzing dust, paint chip and soil samples for lead. (See ELLAP and NLLAP).

Epoxy paint: Paint based on an epoxy resin. An epoxy resin is a cross-linking resin whose reactivity depends on the epoxide group.

Evaluation: Risk assessment, paint inspection, or both.

Examination: See **Clearance examination**.

Examiner: A person certified to conduct clearance examinations or reevaluations.

Exposure monitoring: Sampling and analyzing the air that can be breathed by an employee and the air within the work area to determine the degree of exposure to lead or some other contaminant exposure that can be inhaled.

Exterior work area: Any area such as a porch, stairway, or siding outside a building during lead-based paint hazard control work. This area includes a safety perimeter and access barriers.

Facility: All buildings, contiguous land, structures, and other appurtenances, as well as any improvements, where lead-based paint or hazardous waste is treated, stored, or disposed. A facility may consist of several treatment, storage, or disposal operational units, such as landfills, surface impoundments, or a combination of both.

Federal Register (FR): A daily Federal publication that contains proposed and final regulations, rules, and notices.

Fibermat: A semirigid woven material attached with a liquid adhesive to a surface or substrate.

Field blank: A clean sample of matrix, such as paint, soil, dust, and wipe, carried to the sampling site; exposed to the sampling conditions (for example, by having the bottle caps removed); returned to the laboratory; treated as an environmental sample; and carried through all steps of the analysis. Clean quartz sand, nonlead-containing paint, or a clean wipe could be used as a field blank. The field blank, which should be treated just like the sample, evaluates possible sources of contamination.

FR: See **Federal Register**.

Friction surface: Any interior or exterior surface, such as windows or stair treads, that is subject to abrasion or friction.

Generator: Any person, by site, whose act or operation produces hazardous waste identified or listed in 40 CFR Part 261 or whose act causes a hazardous waste to come under regulation (40 CFR 260.10).

Generator identification number: The unique number assigned by EPA to each generator or transporter of hazardous waste and each treatment, storage, or disposal facility.

Hazardous waste: As defined in EPA Regulations (40 CFR 261.3), the term *hazardous waste* means solid waste or a combination of solid wastes that because of its quantity, concentration, physical, chemical, or infectious characteristics may cause or significantly contribute to increases in mortality or serious and irreversible or incapacitating but reversible illnesses or pose a substantial present or potential hazard to human health or the environment when improperly treated, stored, transported, or disposed. As defined in the regulations, solid waste is hazardous if it meets one of four conditions: (1) exhibits a characteristic of hazardous waste (40 CFR Sections 261.20 through 262.24); (2) has been listed as hazardous (40 CFR Section 261.31 through 261.33); (3) is a mixture containing a listed hazardous waste and a nonhazardous solid waste, unless the mixture is specifically excluded or no longer exhibits any of the characteristics of hazardous waste; and (4) is not excluded from regulation as hazardous waste. For the waste produced in lead-based paint abatement, hazardous waste is waste that contains more than 5 ppm of leachable lead as determined by the TCLP Test, or waste that is corrosive, ignitable, or reactive and is not otherwise excluded.

Hazardous Waste Manifest: See Manifest.

Heat gun: A device capable of heating lead-based paint to separate it from the substrate. For lead hazard control work, the heat stream leaving the gun above 1100°F (some authorities may use a different temperature).

HEPA filter: See **High-Efficiency Particulate Air filter**.

HEPA/wet wash/HEPA cycle: The cleaning cycle that begins with HEPA vacuuming, followed by a wet wash with trisodium phosphate detergent, some other lead-specific cleaning agent, or any other equally effective liquid cleaning agent, followed by a final pass with a HEPA vacuum over the surface.

High-Efficiency Particulate Air (HEPA) filter: A filter capable of removing particles of 0.3 microns or larger from air at 99.97 percent or greater efficiency.

High phosphate detergent: See **Trisodium phosphate detergent**.

Impact surface: An interior or exterior surface such as those on doors and door jambs subject to damage by repeated impacts.

Incinerator: An enclosed device that uses controlled flame combustion and neither meets the criteria for classification as a boiler nor is listed as an industrial furnace.

Industrial hygienist: A person having a college or university degree in engineering, chemistry, physics, medicine, or related physical or biological science who, by virtue of special training, is qualified to anticipate, recognize, evaluate, and control environmental and occupational health hazards and the impact of those hazards on the community.

In-place management: See **Interim controls**.

Inspection: A surface-by-surface investigation to determine the presence of lead-based paint (and in some cases sampling for lead in dust and soil) and a report of the results.

Inspector technician: An individual who has completed training from an accredited program and been licensed to (1) perform inspections to determine and report the presence of lead-based paint on a surface-by-surface basis through the use of onsite testing, such as by an x-ray fluorescence analyzer or through analysis by an accredited laboratory; (2) report the findings of such an inspection; (3) collect environmental samples for laboratory analysis; (4) perform clearance testing and reevaluations; and (5) document successful compliance with lead-based paint hazard control requirements, or standards.

Interim controls: A set of measures designed to temporarily reduce human exposure or possible exposure to lead-based paint hazards. Such measures include specialized cleaning, repairs, maintenance, painting, temporary containment, and management and resident education programs. Monitoring levels of lead exposures by owners and reevaluation by professionals is an integral element of interim controls. Interim controls include dust removal, paint film stabilization, treatment of friction and impact surface, and installation of soil coverings, such as grass or sod, or land-use controls.

Interior window sill: The portion of the horizontal window ledge that protrudes into the interior of the room, adjacent to the window sash when the window is closed; often called the window stool.

Intermediate controls: Coatings or rigid materials such as encapsulants and floor tiles that prevent lead-based paint from causing excessive lead exposures and that rely on adhesion to the existing paint film for their durability.

Investigation: Determining the source of lead exposure for a child with an elevated blood lead level. Investigation consists of administration of a questionnaire, comprehensive environmental sampling, case management, and other measures.

Investigator: A person who conducts an investigation of a dwelling where a resident has an elevated blood lead level. The investigator must be proficient in interviewing techniques, environmental sampling, and interpretation of risk assessment and environmental sampling data.

Laboratory analysis: A determination of the lead content by atomic absorption spectroscopy, inductively coupled plasma emission spectroscopy, or laboratory-based "K" or "L" x-ray fluorescence.

Landfill: A State-licensed or State-permitted disposal facility that meets municipal solid waste standards (see Federal regulations at 40 CFR 258).

Landfill liner: A continuous layer of natural or synthetic materials, beneath a surface impoundment, landfill, or landfill cell or on its sides. The layer restricts the downward or lateral escape of hazardous waste, hazardous waste constituents, or leachate (40 CFR Part 258).

Latex: A waterborne emulsion paint made with synthetic binders, such as 100-percent acrylic, vinyl acrylic, terpolymer, or styrene acrylic. A stable emulsion of polymers and pigment in water.

Lead: Lead includes metallic lead and inorganic and organic compounds of lead.

Lead-based paint: Any paint, varnish, shellac, or other coating that contains lead equal to or greater than 1.0 mg/cm² as measured by x-ray fluorescence detector or laboratory analysis, or 0.5 percent by weight (5,000 µg/g, 5,000 ppm, or 5,000 mg/kg) by laboratory analysis. (Local definitions may differ.)

Lead-based paint hazard: A condition in which exposure to lead from lead-contaminated dust, lead-contaminated soil, or from lead-based paint that has deteriorated or coats accessible, friction, or impact surfaces would result in adverse human health effects, as established by the EPA Administrator under Title IV of the Toxic Substances Control Act.

Lead-based paint hazard control: Activities to control and eliminate lead-based paint hazards, including interim controls, intermediate controls, abatement, and complete removal.

Lead-based paint abatement planner/designer: An individual who has completed an accredited training program for planning and designing lead-based paint abatement projects in target housing.

Lead-based paint worker: See **Worker**.

Lead carbonate: A pigment used in some lead-based paint as a hiding agent; also known as white lead.

Lead-contaminated dust: Surface dust in residences that contains an area or mass concentration of lead in excess of the standard established by the EPA Administrator, pursuant to Title IV of the Toxic Substances Control Act. Until the EPA standards are set, the HUD recommendations for leaded dust standards are 40 µg/ft² on floors, 250 µg/ft² on interior windowsills and 400 µg/ft² on window troughs for clearance.

Lead-contaminated soil: Bare soil on residential property that contains lead in excess of the standard established by the EPA Administrator, pursuant to Title IV of the Toxic Substances Control Act. The interim HUD recommendation is 400 µg/g in high-contact play areas, and 1,200 ppm in other bare areas of the yard. Soil above 5,000 µg/g should be abated by removal or paving.

Lead-free dwelling: A lead-free dwelling contains no lead-based paint, and its interior dust and exterior soil have levels of lead below applicable HUD and EPA standards.

Lead hazard screen: A means of determining whether residences in good condition built between 1960 and 1978 should have a full risk assessment using dust sampling and visual survey.

Lead-poisoned child: A child with a single blood lead level measurement of 20 µg/dL or 15 µg/dL or greater for two measurements taken at least one month apart.

Lead-safe dwelling: A lead-safe dwelling meets the following characteristics: (1) leaded-dust window sills, levels on floors, interior and window troughs are below HUD clearance standards (or EPA health-based standards); (2) the lead levels of the bare soil in outdoor play areas are below EPA health-based standards; (3) no deteriorated known or suspected lead-based paint and no deteriorated paint suspected of containing lead is present on any indoor or outdoor surface; (4) a plan has been implemented to ensure that intact lead-based paint or suspected lead-based paint does not become a lead hazard in the course of routine maintenance and renovation; and (5) periodic surveillance is conducted to ensure that these criteria are met for a specific time period.

Lead-specific detergent: A cleaning agent manufactured specifically for cleaning and removing leaded dust or other lead contamination.

Leaded dust: See **Lead-contaminated dust**.

Leaded zinc: A paint primer made from zinc oxide and lead sulfates.

Licensed: Holding a valid license issued by EPA or by an EPA-approved State program pursuant to Title IV of the Toxic Substances Control Act. The license is based on certification for lead-based paint hazard control work. See **Certified**.

Listed waste: A hazardous waste that has been placed on one of three lists developed by EPA: lists of nonspecific source wastes, specific source wastes, or commercial chemical products. The lists were developed by examining different types of waste and chemical products to see if they exhibit one of the four characteristics, meet the statutory definition of hazardous waste, are acutely toxic or acutely hazardous, or are otherwise toxic.

Maintenance: Work to maintain adequate living conditions in a dwelling that may disturb lead-based paint or paint that is suspected to be lead-based paint.

Manifest: The shipping document, EPA Form 8700-22, or a comparable form required by the State or locality used for identifying the quantity, composition, origin, routing, and destination of hazardous waste during its transport from the point of generation to the point of treatment, storage, or disposal. A shipping document used to keep track of items being transported. Hazardous wastes covered by regulations must be accompanied by a manifest. See hazardous waste.

Mat: See walk-off mat

Matrix blank: A sample of the matrix (paint chips, soil, or dust) but without the analyte lead. This sample goes through the complete analysis, including digestion.

MDL: See **Method detection limit**.

Mean: The arithmetic average of data values; for example, the algebraic sum of the data values divided by the number of data values. When using x-ray fluorescence (XRF), the mean is the average of a series of numerical XRF readings.

Medical removal: The temporary removal of workers due to elevated blood lead levels as defined in the OSHA Lead Standard (29 CFR 1926.62).

Method blank: See **Digestion blank**.

Method detection limit (MDL): The minimum concentration of an analyte that, in a given matrix and by using a specific method, has a 99-percent probability of being identified, qualitatively or quantitatively measured, and reported to be greater than zero.

mg: Milligram; one-thousandth of a gram; a unit of weight.

Micrograms: See μg .

Milligram: See **mg**.

Monitoring: Surveillance on a continuing basis by a property owner of lead-based paint hazard control measures implemented on a property. In contrast, reevaluation is the visual examination and environmental sampling conducted by a certified risk assessor or certified inspector of target housing units that have undergone abatement or interim control interventions (and clearance tests) to determine if lead-based paint hazards have reappeared. Monitoring *and* reevaluations are needed for interim controls, intermediate controls or encapsulation, and enclosure.

Monofil: A State-approved landfill that accepts only construction debris.

Mouthable surface: See **Chewed surface**.

Multifamily housing: Housing that has more than one dwelling unit in one location.

NLLAP requirements: Requirements specified by the EPA National Lead Laboratory Accreditation Program (NLLAP) in order to be accredited for lead analysis in paint, soil, and dust matrixes by an EPA-recognized laboratory accreditation organization.

Offsite paint removal: The process of removing a component of a building and stripping the paint from the component at a paint-stripping facility.

Ongoing monitoring: See **Monitoring**.

Owner: The entity that possesses a dwelling unit: A person, firm, corporation, guardian, conservator, receiver, trustee, executor, government agency or entity, or other judicial officer who, alone or with others, owns, holds, or controls the freehold or leasehold title or part of the title to property, with or without actually possessing it. This definition includes a vendee who possesses the title, but does not include a mortgagee or an owner of a reversionary interest under a ground rent lease.

Oxidation: A chemical reaction that occurs upon exposure to oxygen. Some coatings cure by oxidation; oxygen enters the liquid coating and crosslinks (attaches) the resin molecules. This film-forming method is also called Air Cure or Air Dry. Oxidation also causes rust to form on metals and paint to chalk.

Paint film stabilization: The process of wet scraping, priming, and repainting deteriorated lead-based paint in a dwelling; the process includes cleanup and clearance.

Paint removal: A strategy of abatement that entails removing lead-based paint from surfaces. For lead-hazard control work this can mean using chemicals, heat guns that produce temperatures below 1100°F, and certain contained abrasive methods but not by open flame burning, open abrasive blasting, sandblasting, water blasting, or extensive dry scraping. (Methylene chloride paint removers are also not recommended.)

Patch test: A test method or procedure to assess the adhesion of an encapsulant coating to a substrate covered with a layer or layers of lead paint.

Periodic surveillance: A series of reevaluations. See **Reevaluation** and **Monitoring**.

Personal breathing zone samples: Air samples collected from the breathing zone of a worker (a 1-foot radius in front of the face) but outside the respirator. The samples are collected with a personal sampling pump operating at 2 liters per minute drawing air through a 37 mm mixed cellulose ester filter (closed face) with a pore size of 0.8 microns. See **Exposure monitoring**.

Personal Protective Equipment (PPE): Equipment for protecting the eyes, face, head, and/or extremities, including protective clothing, respiratory devices and protective shields when hazards capable of causing bodily injury or impairment are encountered.

PHA: See **Public Housing Agency**.

Pigment: Insoluble, finely ground materials that give paint its properties of color and hide.

Pigment Volume Concentration (PVC): Pigment volume as a percentage of total nonvolatile ingredients.

Pilot project: In multifamily housing, testing of a lead-based paint hazard control strategy in a limited number of dwellings, usually those that are vacant, to determine the feasibility of carrying out such a strategy in the entire multifamily housing development; usually involves paint testing, air sampling, wipe sampling, worksite preparation, and a variety of lead-based paint hazard control treatments.

Plastic: See **Polyethylene plastic**.

PLBP: Presumed/assumed Lead-Based Paint.

Polyethylene plastic: All references to polyethylene plastic refer to plastic sheeting or polyethylene bags at least 6 mil thick—or doubled bags if 4 mil polyethylene bags are used—or any other plastic material with a thickness whose performance is equivalent or better. Plastic used to contain waste should be capable of completely containing the waste and after being properly sealed, should remain leak-tight with no visible signs of discharge during movement or relocation of the waste.

Polyurethane: An exceptionally hard and wear-resistant coating made by the reaction of polyols with a multifunctional isocyanate, often used to seal wood floors following cleaning after lead-based paint hazard control work.

Precision: The degree to which a set of observations or measurements of the same property, usually obtained under similar conditions, conform to themselves; a data quality indicator. Precision is usually expressed in either absolute or relative terms as standard deviation, variance, or range.

Primary prevention: The process of controlling lead hazards to prevent exposure. See **Secondary prevention** and **Tertiary prevention**.

Primary standard: A substance or device with a property or value that is unquestionably accepted, within specified limits, in establishing the value of the same or related property of another substance or device.

Public Housing Agency (PHA): Any State, county, municipality, or other governmental entity or public body, or agency or instrumentality thereof, authorized to engage or assist in the development or operation of housing for low-income families.

PVC: See **Pigment Volume Concentration**.

Quality Assurance (QA): An integrated system of activities involving planning, quality control, quality assessment, reporting, and quality improvement to ensure that a product or service meets defined standards of quality within a stated level of confidence.

Quality Control (QC): The overall system of technical activities whose purpose is to measure and control the quality of a product or service so that it meets the needs of users. The aim is to provide a level of quality that is satisfactory, adequate, dependable, and economical.

Random sample: A sample drawn from a population in a way that allows each member of the population to have an equal chance of being selected. Random sampling is used to conduct lead-based paint inspections in multifamily dwellings.

RCRA: Resource Conservation and Recovery Act.

Reevaluation: In lead hazard control work, a visual assessment and collection of environmental samples by a certified risk assessor or certified inspector technician to determine if a lead-based paint hazard control measure that has been implemented is still effective and if the dwelling is still lead-safe.

Reference material: A material or substance that has at least one sufficiently well established property that can be used to calibrate an apparatus, assess a measurement method, or assign values to materials.

Reinspection: See **Reevaluation**.

Removal: See **Paint removal**.

Renovation: Work that involves construction and home or building improvement measures such as window replacement, weatherization, remodeling, and repainting.

Replacement: A strategy of abatement that entails the removal of building components that have surfaces coated with lead-based paint, such as windows, doors, and trim, and the installation of new components free of lead-based paint.

Representative sample: A sample of a universe or whole (for example, waste sample pile, lagoon, groundwater, or waste stream) that can be expected to exhibit the average properties of the universe or whole.

Resident: The person who lives in a dwelling.

Risk assessment: An onsite investigation of a residential dwelling for lead-based paint hazards. Risk assessment includes investigating the age, history, management, and maintenance of the dwelling, and the number of children under age 6 and women of child-bearing age who are residents; conducting a visual assessment; performing limited environmental sampling, such as dust wipe samples, soil samples, and deteriorated paint samples; and reporting the results that identify acceptable abatement and interim control strategies based on specific conditions and the owner's capabilities for controlling identified lead-based paint hazards.

Risk assessor: A certified individual who has completed training from an accredited training program and who has been certified to (1) perform risk assessments; (2) identify acceptable abatement and interim control strategies for reducing identified lead-based paint hazards (3) perform clearance testing and reevaluations; and (4) document the successful completion of lead-based paint hazard control activities.

Sample site: A specific spot on a surface being tested for lead concentration.

Saponification: Chemical reaction between alkalis and oil that produces a type of soap. Because of saponification, oil and alkyd coatings will not adhere to masonry substrates, galvanized metals, or zinc-rich primers. Also a form of incompatibility between types of coatings.

Screening: The process of testing children's blood to determine if they have elevated lead levels.

Secondary prevention: The process of identifying children who have elevated blood lead levels and controlling or eliminating sources of further exposure. See **Primary prevention**.

SEL: See **Substrate Equivalent Lead**.

Site: The land or body of water where a facility is located or an activity is conducted. The site includes adjacent land used in connection with the facility or activity.

Small quantity generator: An owner, contractor (generator), or both who produces less than 100 kg of hazardous waste per month, or accumulates less than 100 kg of hazardous waste at any one time, or one who produces less than 1 kg of acutely hazardous waste per month, or accumulates less than 1 kg of acutely hazardous waste at any one time.

Soil: See **Bare soil**.

Solid waste: As defined in the Resource Conservation and Recovery Act, the term *solid waste* means garbage, refuse, sludge from a waste treatment plant, water supply treatment plant, or air pollution control facility, and other discarded materials, including solid, liquid, semisolid, or contained gaseous material resulting from industrial, commercial, mining, and agricultural operations and from community activities. The term does not include solid or dissolved material in domestic sewage or solid or dissolved materials in irrigation return flows or industrial discharges that are point sources subject to permits under the Clean Water Act, nor does the term include special nuclear or byproduct material as defined by the Atomic Energy Act of 1954.

Spectrum analyzer: A type of x-ray fluorescence analyzer that provides the operator with a plot of the energy and intensity, or counts of both "K" and "L" x-ray spectra, as well as a calculated lead concentration.

Spiked matrix: See **Spiked sample**.

Spiked sample: A sample prepared by adding a known mass of the target analyte (for example, leaded dust) to a specified amount of matrix sample (for example, wipe media) for which an independent estimate of target analyte concentration is available. Spiked samples are used to determine, for example, the effect of the matrix on a method's recovery efficiency.

Spot-prime: To apply a paint primer to localized areas of exposed substrate.

Standard deviation: A measure of the precision of the readings; the spread of the deviations from the mean. The smaller the standard deviation, the more precise the analysis, and the less variation there is when an analysis is repeated. The standard deviation is calculated by first obtaining the mean, or the arithmetic average, of all the readings. A formula is then used to calculate how much the values vary from the mean—standard deviation is the square root of the arithmetic average of the squares of the deviation from the mean. Many hand calculators have an automatic standard deviation function.

Standard reevaluation schedule: A schedule that determines the frequency of reevaluations that should be performed on a property. The schedule is based on the lead-based paint hazard control method that is implemented and the existing conditions.

Standard reference material (SRM): A certified reference material produced by the U.S. National Institute of Standards and Technology and characterized for absolute content independent of analytical method.

Subsample: A representative portion of a sample. A subsample may be taken from either in the field or in a laboratory.

Substrate: A surface on which paint, varnish, or other coating has been applied or may be applied. Examples of substrates include wood, plaster, metal, and drywall.

Substrate effect: The radiation returned to an x-ray fluorescence analyzer by the paint substrate or underlying material, apart from any radiation returned by any lead present. This radiation, when counted as lead x-rays by an XRF, contributes to substrate equivalent lead (bias). The inspector may have to compensate for this effect when using XRF analyzers.

Substrate Equivalent Lead (SEL): The average of at least three x-ray fluorescence single cycle readings on an unpainted surface; used to calculate the corrected lead concentration on a surface by the following formula: Apparent Lead Concentration–Substrate Equivalent Lead = Corrected Lead Concentration.

Target housing: Any residential unit constructed before 1978, except those developed specifically for the elderly or persons with disabilities—unless any child who is less than 6 years of age resides or is expected to reside in the dwelling—or any dwelling with no bedrooms. In the case of jurisdictions that have banned the sale or use of lead-based paint before 1978, the Secretary of Housing and Urban Development may designate an earlier date defining target housing.

Targeted sample: A sample of dwelling units selected from an apartment building or housing development using information supplied by the owner. The units selected are likely to have the greatest probability of having lead-based paint hazards. A targeted sample is usually selected for performing risk assessments in multifamily housing when it is not possible to select a worst-case sample. See also **Worst-case sample**.

Worst-case sample.

TCLP: See **Toxicity Characteristic Leaching Procedure**.

Tertiary prevention: Medically treating children with elevated blood lead levels.

Toxicity Characteristic Leaching Procedure (TCLP): A laboratory test method to determine if excessive levels of lead or other hazardous materials could leach into groundwater; usually used to determine by its toxicity characteristic if the waste is hazardous.

Trained: Successful completion of a training course on a particular discipline. As applied to lead hazard control work, the course must be accredited by EPA or by an EPA-approved State program, pursuant to Title IV of the Toxic Substances Control Act.

Transporter: A person who transports hazardous waste offsite within the United States by air, rail, highway, or water, if the transport requires a manifest under 40 CFR Part 260.10.

Treatment: In lead-based paint hazard control, a method designed to control lead-based paint hazards. Treatment includes interim controls, intermediate methods, abatement, and full removal. Hazardous waste treatment is a method, technique, or process, including neutralization, that is designed to change the physical, chemical, or biological character or composition of hazardous waste so as to neutralize it, render it nonhazardous or less hazardous, recover it, make it safer to transport, store, or dispose, or allow for easier recovery, storage, or volume reduction.

Treatment, Storage, and Disposal (TSD) facility: A facility licensed to handle hazardous waste.

Trisodium Phosphate (TSP) detergent: Detergent that contains at least 5 percent trisodium phosphate.

Truck-mounted vacuum unit: A vacuum system whose components, except for hoses and attachments, are located outside the building undergoing dust removal. Multiple hoses are used simultaneously and the exhaust is vented to the outside so that the dust inside the building is not disturbed.

TSD: See **Treatment, Storage, and Disposal facility**.

TSP: See **Trisodium phosphate detergent**.

µg (or ug): Micrograms. The prefix micro- means 1/1,000,000 (or one-millionth). A microgram is 1/1,000,000 of a gram and 1/1,000 of a milligram. A microgram is equal to about 35/1,000,000,000 (thirty-five billionths) of an ounce. An ounce is equal to 28,400,000 µg.

Urethane-modified alkyd: An alkyd molecule that has been chemically modified by the incorporation of a urethane. A coating, often a varnish, that uses a urethane-modified alkyd resin in the binder.

Useful life: Life expectancy of a coating before it requires refinishing or some other form of maintenance.

VOC: See **Volatile Organic Compound**.

Volatile Organic Compound (VOC): Substances that vaporize or evaporate from a coating during the coating-curing process.

Walk-off mat: A washable fibrous material preferably with a rubber or vinyl backing positioned at main entryways to reduce transport of lead dust and lead soil into the dwelling interior.

White lead: A white pigment; usually lead carbonate.

Windowsill: See **Interior window sill**.

Window stool: See **Interior window sill**.

Window trough: The portion of the horizontal window sill that receives the window sash when the window is closed; often located between the storm window and the interior window sash (sometimes called the window well). If there is no storm window, the window trough is the portion of horizontal window trim that receives both the upper and lower window sash when the sashes are closed.

Window well: See **Window trough**.

Worker: An individual who has completed training in an accredited program to perform lead-based abatement in target housing.

Worksite: A hallway, room or group of rooms, or exterior where a lead-based paint hazard control measure takes place.

Worksite preparation level: A set of measures designed to protect residents and the environment from leaded dust, paint chips, or other forms of lead contamination through the erection of barriers and the establishment of access control, resident relocation or movement restrictions, warning signs, ventilation, and other measures.

Worst-case sample: A sample of dwelling units selected on the basis of a walk-through visual examination by a risk assessor of all dwelling units in a housing development or apartment building to determine which ones are likely to have the greatest probability of containing lead-based paint hazards. See also **Targeted sample**.

XRF analyzer: An instrument that determines lead concentration in milligrams per square centimeter (mg/cm²) using the principle of x-ray fluorescence (XRF). Two types of XRF analyzers are used, direct readers and spectrum analyzers. In these *Guidelines*, the term XRF analyzer refers to portable instruments manufactured to analyze paint only, and does not refer to laboratory-grade units or portable instruments designed to analyze soil.

Renewal Housing Associates, LLC

Two Union Street, Suite 500
Portland, Maine 04101

RE: Lead-Based Paint Inspection and Risk Assessment at:
Nelson Park Apartments
1994 Maryland Avenue
Columbus, Ohio 43219
Bureau Veritas Project No.: 156846.22R000-001.026

To Whom it May Concern:

Bureau Veritas, with the assistance of their subcontractor Pinnacle Environmental Consultants, Inc, has completed a Lead-Based Paint (LBP) Inspection and Risk Assessment. The inspection and risk assessment were completed in general accordance with United States Department of Housing and Urban Development (HUD) *Guidelines for the Evaluation and Control of Lead-Based Paint Hazards in Housing*, Chapters 5 and 7 (Revised 2012). Onsite activities were performed by Charles McKee and Christian Matecki, United States Environmental Protection Agency (USEPA) Risk Assessors on May 30-June 2, 2023.

LBP Inspection – Summary of Findings

The LBP Inspection was conducted in forty-nine (49) units. The results of the inspection identified zero (0) components that are considered to contain LBP.

Visual assessment of the LBP determined that none of the components are in deteriorated condition.

LBP Risk Assessment – Summary of Findings

Dust Wipe Sampling

Dust wipe samples were collected throughout the Project in each unit accessed as part of the LBP Risk Assessment. Analysis of the samples showed that lead concentrations exceeded the HUD Guidelines (10 micrograms per square foot [ug/ft²] for floors and 50 ug/ft² for window sills) in one (1) of the four hundred and fifty-four (454) wipe samples collected.

Locations of Property-Wide Dust-Lead Hazards		
Apartment/Area	Location	Component
Unit 1902	Living Room	Floor

Please refer to the attached report prepared by Pinnacle Environmental Consultants, LLC for options for addressing dust-lead hazards and dust-lead exceedances.

Soil Sampling

The soil samples were collected from various locations throughout the Project from along the perimeter of the building. Analysis of the soil samples indicates lead concentrations that are below the HUD guidelines of 1,200 parts per million (ppm) for other areas of bare soil. No soil lead hazards were identified at the Project.

Recommendations

Based on the results of the Inspection and LBP Inspection and Risk Assessment, Bureau Veritas offers the following recommendations:

- Re-evaluation in two years from the date of this report. June 21, 2025.
- Areas listed above with dust-lead hazards should be addressed using special wet cleaning of the affected areas. Minimum specifications include HEPA vacuuming, wet wiping, and final HEPA vacuuming. The USEPA require clearance sampling following abatement activities.
- Soil sampling results were below the HUD Guidelines of 1,200 ppm for drip line samples and no further action is required with lead soil hazards at this time.

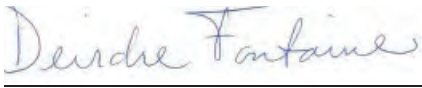

The independent conclusions represent our professional judgment based on information and data available to us during the course of this assignment. Factual information regarding operations, conditions, and test data provided by the Client or their representative has been assumed to be correct and complete. The conclusions presented are based on the data provided, observations, and conditions that existed on the date of the on site visit.

This report has been prepared for and is exclusively for the use and benefit of the Client identified on the cover page of this report. The purpose for which this report shall be used shall be limited to the use as stated in the contract between the client and Bureau Veritas.

This report, or any of the information contained therein, is not for the use or benefit of, nor may it be relied upon by any other person or entity, for any purpose without the advance written consent of Bureau Veritas. Any reuse or distribution without such consent shall be at the client's or recipient's sole risk, without liability to Bureau Veritas.

If you have any questions regarding this report, please contact me below at (800) 733-0660, Ext. 6337.

Sincerely,

Deirdre Fontaine
Expanded Environmental Services Specialist
Bureau Veritas

Disclosure Requirements

Ohio law (section 5301.30 of the Revised Code) requires every person who intends to transfer any residential real property by sale, land installment contract, lease with option to purchase, exchange, or lease for a term of ninety-nine years and renewable forever, to complete and provide a copy to the prospective transferee of the applicable property disclosure forms, disclosing known hazardous conditions of the property, including lead-based paint hazards.

Federal law (24 CFR part 35 and 40 CFR part 745) requires sellers and lessors of residential units constructed prior to 1978, except housing for the elderly or persons with disabilities (unless any child who is less than six years of age resides or is expected to reside in such housing) or any zero-bedroom dwelling to disclose and provide a copy of this report to new purchasers or lessees before they become obligated under a lease or sales contract. Property owners and sellers are also required to distribute an educational pamphlet approved by the United States Environmental Protection Agency and include standard warning language in leases or sales contracts to ensure that parents have the information they need to protect children from lead-based paint hazards.

1.0 OBJECTIVE

This report details the findings of the limited lead risk assessment performed between May 30 and June 2, 2023 by Pinnacle Environmental Consultants (Pinnacle) at Nelson Park Apartments in Columbus, Ohio. Nelson Park Apartments consists of 177 residential units in 44 buildings constructed in 1958, of which 49 units were evaluated during this risk assessment project, as indicated by the Department of Housing and Urban Development's **GUIDELINES FOR THE EVALUATION AND CONTROL OF LEAD-BASED PAINT HAZARDS IN HOUSING**. The purpose of this report is to present the results of the lead risk assessment performed at the residential apartment complex. The survey was conducted in advance of renovation activities being performed.

2.0 EXECUTIVE SUMMARY

2.1 Limited Lead Risk Assessment

A total of four hundred and fifty-four (454) dust wipe samples were collected from within the 49 randomly selected residential units, with no common area samples as all units have individual access and no common areas are present in this residential complex. The samples included fourteen blank samples, which were submitted for quality control purposes.

Mr. David Mousie, an Ohio Department of Health Licensed Lead Risk Assessor license No. LA9531, conducted the risk assessment between May 30 and June 2, 2023. All sampling was performed as outlined in the HUD Guidelines and Ohio Department of Health regulations. The specific sampling procedures utilized in this survey are described in Chapter 5 of the Guidelines and 35 CFR subpart R section 35.1320 in the federal regulation. See Appendix 2 for analytical laboratory reports and chain-of-custody information. A summary of the analytical laboratory results is presented in Appendix 3.

3.0 BACKGROUND

Nelson Park Apartments consists of 177 residential units in 44 buildings which were constructed in 1958.

4.0 LABORATORY LEAD DUST WIPE SAMPLE ANALYSIS

The lead dust wipe and soil samples were submitted to Schneider Laboratories Global, Inc., an Environmental Lead Proficiency Analytical Testing (ELPAT) accredited laboratory, located at 2512 West Cary Street in Richmond, Virginia for analysis. See Appendix 2 for laboratory reports and chain-of-custody information.

5.0 SUMMARY OF LEAD DUST AND SOIL SAMPLE LOCATIONS ABOVE HUD/ODH LEVELS

Any sample results which exceed the established HUD and/or ODH regulatory limits are listed below:

Unit 1902	Living Room Floor	82.7 ug/ft ²
-----------	-------------------	-------------------------

Other than those listed above, all sample results were below the established regulatory levels. The HUD and ODH regulatory levels for floors inside the residence and exterior living areas or on any horizontal surface other than a window sill or trough is 40 µg/ft² with the window sill regulatory level being 250 µg/ft². A summary of sample locations and associated levels is presented in Appendix 3.

6.0 LEAD HAZARD LEVELS

Lead is hazardous, especially for children who are six years of age or younger. Lead can reduce intelligence, cause behavior and learning problems, slow growth and impair hearing. Children can get lead in their bodies by breathing or swallowing lead dust, or by eating soil or paint chips with lead in them.

Lead-Based Paint

Lead-based paint is any paint or surface coating that contains lead equal to or in excess of 1.0 milligrams per square centimeter (1.0 mg/cm²) or equal to or in excess of 0.5% by weight. **Lead-based paint is hazardous when it is:**

1. On a **friction surface**. The paint on surfaces like window sashes and jambs can break down during normal use and release lead dust. If dust levels on the nearest flat surface exceed acceptable levels, then the friction surface is a hazard.
2. On a **chewable surface** that has evidence of teeth marks. These are surfaces, such as window sills, railings, door edges and stair edges that that a young child can mouth or chew.

3. On an **impact surface** where there is damaged or otherwise deteriorated paint from impact from a related building component (such as a door and door frame banging together).
4. **Deteriorated, e.g., peeling, chipping, chalking, or cracking.** When lead paint breaks down or is disturbed due to remodeling, renovating, dry scraping or water damage, paint chips and dust can be released that can contaminate the home and be easily ingested by young children through hand-to-mouth activity.

Lead Dust Hazard Levels

- **40** micrograms per square foot ($\mu\text{g}/\text{ft}^2$) on **floors** of interior or exterior living areas or on any horizontal surface other than a window sill or trough
- **250** $\mu\text{g}/\text{ft}^2$ on interior **window sills** or exterior living area window sills
- **400** $\mu\text{g}/\text{ft}^2$ for **window troughs**

Lead Soil Hazard Levels

- **400** $\mu\text{g}/\text{g}$ (ppm or parts per million) for bare soil in **play areas** or
- **1200** ppm (composite or average) in bare soil in **non-play areas**

If the results are equal to or higher than the levels noted above, a lead hazard is present.

7.0 LEAD HAZARD CONTROL METHODS

The methods of controlling lead hazards are listed below:

- (1) **Deteriorated Lead-Based Paint on Non-friction or Non-impact Surfaces:** Examples include interior or exterior walls, ceilings, trim, casings, baseboards, etc.
 - a) **Removal** of the lead-based painted component **and replacement** with a lead-free component;
 - b) **Paint removal** by separation of the lead-based paint from the substrate using heat guns (operated below eleven hundred degrees Fahrenheit), chemicals, or certain abrasive measures either onsite or offsite;
 - c) **Enclosure** of the lead-based painted component with durable materials. Durable materials include wallboard, drywall, paneling, siding, coil stock and the sealing or caulking of edges and joints so as to prevent or control chalking, flaking, peeling, scaling or loose lead-containing substances from becoming part of house dust or otherwise accessible to children;
 - d) **Encapsulation** of the lead-based painted component by coating and sealing of the component with a durable surface coating approved in rule 3701-32-13 of the Administrative Code;
 - e) **Paint stabilization** as defined in rule 3701-32-01 of the Administrative Code and a written ongoing maintenance and monitoring schedule; or

f) Any other lead-safe method of permanently removing the lead hazard.

(2) Deteriorated Lead-Based Paint on Friction or Impact Surfaces:

Examples include window systems, doors, floors, etc.

- a) **Removal** of the lead-based painted component and replacement with lead-free components;
- b) **Lead-based paint removal** by separation of the lead-based paint from the substrate using heat guns (operated below eleven hundred degrees Fahrenheit), chemicals or certain abrasive measures either onsite or offsite;
- c) **Enclosure** of the impact surfaces with durable materials. Durable materials include wallboard, drywall, paneling, a quarter inch or thicker plywood or other underlayment for floors, coil stock and the sealing or caulking of edges and joints so as to prevent or control chalking, flaking, peeling scaling, or loose lead-containing substances from becoming part of house dust or otherwise accessible to children. The underlayment for floors must be covered with a cleanable, impermeable surface;
- d) **Elimination of the friction points** or application of a treatment that will prevent abrasion of the friction surface and a written ongoing maintenance and monitoring schedule; or
- e) Any other lead-safe method of permanently removing the lead hazard,

(3) Chewable Surfaces:

Examples include window sills, railings and other child-accessible surfaces that show evidence of teeth marks.

- a) **Removal** of the lead-based painted component **and replacement** with lead-free components;
- b) **Lead-based paint removal** by separation of the lead-based paint from the substrate using heat guns (operated below eleven hundred degrees Fahrenheit), chemicals or certain abrasive measures either onsite or offsite;
- c) **Enclosure** of the lead-based painted component with a material that cannot be penetrated by a child's teeth;
- d) **Encapsulation** of the lead-based painted component by coating and sealing of the component with a durable surface coating approved in rule 3701-32-13 of the Administrative Code; or
- e) Any other lead safe method of permanently removing the lead hazard.

(4) Lead-contaminated Dust:

- a) Elimination or control of the source creating the lead-contaminated dust using an appropriate control method listed above and followed with specialized cleaning to eliminate the lead-contaminated dust. Specialized cleaning includes the use of a HEPA vacuum, wet-mopping and/or wet-scrubbing;
- b) Elimination of the lead-contaminated dust when the source creating the lead-contaminated dust cannot be identified through specialized cleaning and a written ongoing maintenance and monitoring schedule. Specialized cleaning includes the use of a HEPA vacuum, wet-mopping or wet-scrubbing.

(5) Lead-contaminated Soil:

- a) **Covering** of the lead-contaminated bare soil with a permanent covering such as concrete or asphalt,
- b) **Removal** of the top six inches of lead-contaminated bare soil and replacing it with six inches of new soil having a lead concentration of less than two hundred parts per million;
- c) Covering of the lead-contaminated soil with an **impermanent covering** and a written ongoing maintenance and monitoring schedule. Impermanent covering includes sod and artificial turf. Gravel and mulch may be used as an impermanent covering if applied at a minimum of six inches in depth;
- d) Any other lead safe method of permanently removing the lead hazard.

(6) Lead-contaminated Water Pipes

- a) Removal of the plumbing fixtures and replacement with lead-free fixtures;
- b) Flushing of the water lines that are used for drinking or cooking for a minimum of one minute when water has not been used in the last six hours; or
- c) Any other lead safe method of permanently removing the lead hazard.

The following practices are PROHIBITED:

- (1) Open flame burning or torching;
- (2) Machine sanding or grinding without a HEPA local vacuum exhaust tool;
- (3) Abrasive blasting or sandblasting without a HEPA local vacuum exhaust tool;

- (4) Use of a heat gun operating above one thousand one hundred degrees Fahrenheit;
- (5) Charring paint;
- (6) Dry sanding;
- (7) Dry scraping, except when done as follows:
 - a) In conjunction with a heat gun operating at not more than one thousand one hundred degrees Fahrenheit;
 - b) Within one foot of an electrical outlet;
 - c) To treat defective paint spots totaling not more than two square feet in an interior room or space or twenty square feet on an exterior surface.
- (8) Uncontained hydro blasting or high-pressure washing; and
- (9) Paint stripping in a poorly ventilated space using a volatile stripper that is considered a hazardous substance under 16 C.F.R. 1500.3 or a hazardous chemical under 29 C.F.R. 1910.1200 or 29 C.F.R. 1926.59 in the type of work being performed.

Important Notes:

- Residents, especially children and pregnant women, must be kept away from the lead hazard control area. Proper and thorough cleanup is important so that dust and paint chips are not left behind at the end of the job.
- After lead hazard control work is done, the structure must pass a **clearance examination**, which may include dust wipe samples, to ensure that no lead dust, debris or paint chips are left behind.
- Paint stabilization, interim window treatments and impermanent covering of lead-contaminated soil require a written ongoing maintenance and monitoring schedule and an annual clearance examination. It is recommended that a visual check of past repairs involving painted surfaces should be done annually and at unit turnover.
- Other surfaces that measured below hazard limits should also be addressed to prevent them from becoming hazardous. It is recommended that lead-safe work practices be used when such surfaces are repaired or replaced.

8.0 CONCLUSIONS AND RECOMMENDATIONS

Lead-based paint hazards as defined by HUD, ODH and EPA, were identified in one dust sample collected from the Living Room floor in Unit 1902.

It is recommended that the suggested lead hazard control measures discussed in Section 7.0 be followed to reduce the likelihood of creating a lead hazard in the future. Pinnacle recommends compliance with 40 CFR 745, the EPA Lead Renovation, Repair, and Painting Program during renovation activities involving any of the lead containing components that were identified as well as similar components that were not tested. Pinnacle also recommends specialized cleaning activities be performed throughout the residence to reduce the lead levels found in several of the dust samples.

Permanent corrective lead hazard control measures include the removal of lead-based paint; enclosure, encapsulation, or replacement of building components coated with lead-based paint; and removal of lead-contaminated soil or overlaying of soil with a durable covering such as asphalt. (Grass, sod and mulch are considered interim control measures.)

Temporary corrective measures, using lead-safe work practices, include specialized cleaning, repairs, maintenance, temporary containment, paint stabilization and management and resident education programs. Paint stabilization is the process of repair of any underlying conditions, wet scraping, priming, and repainting surfaces; paint stabilization includes cleanup and clearance.

More information is available from a certified risk assessor, HUD's lead website (www.hud.gov/offices/lead), or the National Lead Information Clearinghouse (1-800-424-LEAD).

1. Executive Summary and Certification

Bureau Veritas has completed an Asbestos Operations and Maintenance (O&M) Program report for the Nelson Park Apartments, which is located at 1994 Maryland Avenue in Columbus, Ohio 43219. Bureau Veritas previously performed an Environmental Site Assessment at the property (Bureau Veritas Project No. 156846.22R000-001.129). In the prior report, Bureau Veritas stated that:

- The Project, originally constructed in 1958, is currently developed as a multi-family residential community, comprised of 45 two-story buildings, with 177 units.

This O&M Plan is based on the following recommendation found in that report:

- Any ACMs that will not be disturbed should be managed in place using an O&M Program. As part of an O&M Program any contractors bidding on or performing work in the area should be made aware of the presence and locations of ACM's.

The O&M Program report, which was prepared at the Client's request, utilizes methods and procedures consistent with good commercial or customary practice designed to conform to acceptable industry standards and applicable federal, state, and local regulations. Furthermore, the O&M Program preparer, listed below, is professionally trained, experienced, and qualified in accordance with industry standards to complete this O&M Program report.

The independent conclusions represent Bureau Veritas's best professional judgment based on information and data available to us during the course of this assignment. Factual information regarding operations, conditions, and test data provided by the Client, owner, or their representative have been assumed to be correct and complete. Additionally, the conclusions presented are based on the conditions that existed and the information available at the time of the assignment.

Prepared by Bureau Veritas:

Gregory P. Shingler
Hazard Evaluation Specialist (Ohio)
Technical Report Reviewer
Bureau Veritas

2. Introduction

This General Operations and Maintenance (O&M) Program established by Bureau Veritas is for a property known as the Nelson Park Apartments, which contains asbestos-containing materials (ACMs) or Presumed/Assumed asbestos-containing materials (PACM¹). This O&M Program covers ACMs/PACMs that are in good condition and are non-friable, and/or of the type defined as miscellaneous by the Environmental Protection Agency (EPA)².

The purpose of this Program is to minimize the risk of exposure to building occupants by maintaining existing ACMs/PACMs in good condition. Existing friable asbestos hazard conditions must be addressed by remediation procedures that are beyond the scope of this O&M Program. Such remediation activities should be conducted by licensed asbestos contractors (See Section 4.4).

Part of the O&M Plan includes the appointment of an Asbestos Program Manager (APM). The position of the APM is frequently held by the building engineer, superintendent, facilities manager, or safety and health director. Regardless of who holds the position of APM, the EPA strongly recommends that the APM be properly qualified through training and experience (refer to Section 4.1).

Nonetheless, the Asbestos Program Manager (APM) should ensure that activities of asbestos contractors follow applicable regulatory requirements and guidelines (as briefly discussed in Section 5).

This O&M Program has been designed to minimize the potential release of asbestos fibers during general work activities, scheduled maintenance and renovation of the building. This Program is designed utilizing the EPA's Document, *Managing Asbestos in Place; A Building Owner's Guide to Operations and Maintenance Programs For Asbestos-Containing Materials* and the National Institute of Building Sciences (NIBS) *Guidance Manual: Asbestos Operations and Maintenance Work Practices*.

Abbreviations and acronyms that are used in this O&M Program are defined in Appendix I-Glossary, located at end of this document.

This Program encompasses Class III and Class IV Asbestos Work (based on OSHA asbestos work classifications found in 29 CFR 1926.1101). In addition to the following *Class IV Asbestos Work* definition, further differentiation between acceptable and unacceptable O&M activities is provided in Section 8.0 (O&M Work Practices). Class III and Class IV Asbestos Work are defined as follows:

- **Class III Asbestos Work:** Repair and maintenance operations, where ACM is likely to be disturbed. This disturbance includes cutting away small amounts of ACM, no greater than the amount that can be contained in one standard sized glovebag or waste bag in order to access a building component. In no event shall the amount of ACM so disturbed exceed that which can be contained in one glove bag or waste bag, which shall not exceed 60 inches in length and width.

This Program does not include all the necessary information to complete Class III Asbestos Work (as defined by OSHA in 29 CFR 1926.1101). Class III work requires detailed description of work practices and additional information regarding worker protection. All necessary additional information for completing Class III Asbestos Work can be obtained through the training programs that must be completed by Class III workers.

- **Class IV Asbestos Work:** Maintenance and custodial construction activities during which employees contact, but do not disturb, ACM or PACM. A "disturbance" of ACM/PACM refers to any activity that disrupts the matrix of ACM or PACM, crumbles or pulverizes ACM or PACM, or generates visible debris or dust from ACM or PACM. Class IV Asbestos Work also involves activities to clean up dust, waste and debris resulting from Class I, II, and III activities. However, Class I and II activities are categories for asbestos removal work that are performed by licensed abatement contractors; and therefore, go beyond the scope of an O&M Program.

¹ Presumed asbestos-containing material means thermal system insulation and surfacing material found in buildings constructed no later than 1980.

² According to the EPA, a miscellaneous ACM is a material that is not sprayed-on or troweled-on surfacing material, and is not used as thermal insulation. Miscellaneous materials could include floor tile and ceiling tile.

3. O&M Program Implementation Overview

This O&M Program is established with the intent of managing ACMs/PACMs as follows:

- Abate any existing asbestos hazards utilizing a licensed asbestos removal contractor.
- ACMs/PACMs in fair to good condition will be maintained in-place in their existing condition.
- Establish procedures to minimize and/or avoid ACM/PACM disturbance.
- Contract asbestos removal activities prior to any maintenance/repair, renovation, or other activities that may cause an asbestos disturbance. [In-house asbestos abatement capabilities can be established. However, this is not within the scope of this O&M Program report. Guidance for in-house asbestos work can be obtained upon O&M worker training or can be provided by Bureau Veritas as a supplement to this O&M report.]

Listed below is a checklist of the programs and/or procedures that should be implemented as part of this O&M Program. These programs/procedures include immediate and on-going activities for proper management of ACMs and PACMs at the Project. Upon implementation of the O&M Program, the APM should be able to check off each of the activities listed within the **O&M Implementation Checklist**. Within the **O&M Implementation Checklist**, references are made to report section(s) that provide further description.

3.1. O&M Implementation Checklist

The APM should check that each of the activities/programs listed below has been completed or is implemented on an on-going basis.

- **APM Training – Minimum two day EPA Accredited O&M training (Section 7.1).**
- **Worker Training (Section 7.1).**
- **Visual Reinspection of Project by the APM after completion of O&M training (Section 7.2).**
- **Initial Clean-Up, Abatement, and/or Testing of known or potential friable asbestos hazards (Section 7.3).**
- **Maintenance and Custodial Personnel (if applicable) – Awareness Training (2-Hour).**
- **Maintenance Personnel (if applicable) – O&M Worker Training (2-day), if workers conduct work that could potentially disturb ACM in quantities less than three square feet or three linear feet.**
- **Employee, Tenant (if applicable), and Contractor Notifications (Section 7.4).**
- **Asbestos Labeling (Section 7.5), if necessary.**
- **Signage (Section 7.6), if necessary.**
- **Periodic Surveillance procedures (Section 7.7).**
- **Record Keeping procedures (Section 7.8).**
- **Work Control/Permit System (Section 9.0).**

3.2. Statement of Intent

It is Management’s policy that deteriorated asbestos can be prevented at the Nelson Park Apartments by diligent upkeep of the structure. As part of this commitment, Management will use this Asbestos O&M Plan as a guidance document to help maintain the Property in good repair.

Signed: _____ Date: _____

Printed Name: _____

3.3. Annual Review

It is the policy of Management to review this Asbestos O&M Plan on an annual basis (at a minimum) and ensure that the plan is being adhered to. This O&M Plan cannot be modified without prior approval from the Property Owner or their representative.

This O&M Plan was last reviewed by:

4. Responsibilities

4.1. Asbestos Program Manager

Designation: The position of Asbestos Program Manager (APM), as appointed by the Property Management, is to be held by:

Qualifications: The APM should be properly qualified, through training and experience. The APM should also be trained in aspects of asbestos handling appropriate for the nature of work, to include procedures for setting up glove bags and mini-enclosures, practices for reducing asbestos exposures, use of wet methods, the contents of applicable OSHA, EPA and state regulations, and the identification of asbestos. Completion of an EPA approved Operations and Maintenance course is required. Bureau Veritas recommends that the APM acquire EPA accreditation under the Asbestos Hazard Emergency Response Act (AHERA) or state certification as a Building Inspector/Management Planner and/or Abatement Supervisor.

Duties: Act as the Competent Person for all class IV asbestos work in the building. As such, the APM's duties include health and safety inspections of custodial operations where ACM may be encountered. These inspections should be made at intervals sufficient to assess whether conditions in the work area have changed, and at any reasonable time at employee request.

Perform regular visual inspections of the ACM/PACM, documenting material condition, assessing the material's hazard potential and scheduling appropriate response actions.

Ensure that workers are properly trained in proper asbestos O&M techniques. In addition, he or she will properly notify and oversee the custodial and maintenance staffs, tenants, contractors, and outside service vendors with regard to all asbestos-related activities.

The APM will only employ qualified and licensed asbestos abatement contractors (See also Section 4.4) for abatement projects, independent of the asbestos consultant and the licensed laboratory.

The APM will affirm that any contractors/consultants that are engaged follow appropriate worker protection including respiratory protection, protective clothing, and hygiene facilities, and utilize environmentally protective practices including designation of regulated areas, use of safe housekeeping procedures, and posting of necessary signage.

The APM will confirm that all appropriate regulatory agency notification and personnel notifications have been completed. More detailed understanding of appropriate contractor work practices can be obtained in the various sections of this O&M report, and will also be obtained upon APM training.

The APM will ensure proper disposal of all ACM waste generated and that the recordkeeping requirements of this Program are met and maintain the Program files.

The APM will notify those whose activities may disturb ACM/PACM.

4.2. Maintenance and Custodial Staff

Qualifications: All maintenance and custodial staff shall have annual asbestos awareness training at a minimum. A two-hour initial training course and two-hour annual refresher course will meet this requirement.

Duties: Conduct ACM surveillance on a continuous basis as part of regular duties. Any damaged ACM/PACM shall be reported to the APM immediately and documented in the Program files.

Assist the APM as necessary.

4.3. Asbestos Consultant

Designation: Bureau Veritas has developed the Program.

Duties: As part of an annual update (separately proposed), Bureau Veritas can review the success of Program implementation as part of a reinspection and update. As part of this update, Bureau Veritas will notify the Client of any changes in regulations that may affect the Program.

In general, an asbestos consultant can (1) design large abatement projects, (2) observe the work of abatement contractors, (3) inform applicable employees of the presence of ACM prior to the abatement work being performed, (4) conduct air monitoring before, during, and after abatement projects, as appropriate, and (5) prepare and submit final abatement project reports.

Preparation of a specification or detailed scope of work will be necessary for major asbestos abatement activities. The specification shall be site-specific and detailed for a particular project or operation. Specifications will be required for all major work by abatement contractors, except for routine operations conducted under the guidance of the designated environmental consultant.

4.4. Asbestos Removal Contractor

Duties: Any contractor hired to perform activities at the facility within or beyond the extent of the Program shall follow the standards and procedures of the Program as well as applicable laws and regulations.

Asbestos Abatement Contractors should be fully licensed and are responsible for all asbestos clean up, repair and abatement in accordance with all federal, state and local regulations. Abatement and disposal of ACM will be conducted in accordance with applicable laws and regulations and within generally accepted standards of the asbestos abatement industry.

5. Asbestos Regulations

The asbestos regulations listed in this section shall be considered part of this Program. In the case of conflict between federal and state regulations, the more stringent regulations apply.

5.1. Occupational Safety and Health Administration

29 CFR 1910.1001	Occupational Exposure to Asbestos; General Industry
29 CFR 1926.1101	Occupational Exposure to Asbestos; Construction Industry
29 CFR 1910.134	Use of Respirators

5.2. Environmental Protection Agency

40 CFR 61, Subpart M	National Emission Standard for Hazardous Air Pollutants (NESHAP); Asbestos Regulations
40 CFR 763, Appendix C to Subpart E	Asbestos School Hazard Abatement Reauthorization Act (ASHARA)/ Asbestos Model Accreditation Plan

5.3. State of Ohio Asbestos Regulations

Ohio Revised Code (ORC)	
Ohio Administrative Code (OAC)	
OAC 3701 – 34 – 06	Asbestos Hazard Evaluation Specialist application content, qualifications, and standards of conduct.
OAC 3745 – 20	Asbestos Emission control
ORC § 3710	Asbestos abatement - licensing and accreditation standards
1 ORC § 153.15	Evaluation of asbestos hazard and appropriate response.
23 ORC § 2305.09	Limitation for School District Action Concerning Asbestos.
ORC §5301.30	Requires every person who intends to transfer any residential property by sale, land installment contract, lease with option to purchase, exchange, or lease for a term of 99 years and renewable forever, to complete and provide a copy to the prospective transferee of the applicable property disclosure forms.

6. Asbestos-Containing Materials at Nelson Park Apartments

The list of ACMs is based on information contained in the following report:

- Asbestos Survey for Nelson Park Apartments prepared by Bureau Veritas, with the assistance of their subcontractor RiskNomics LLC, dated December 13, 2018 (Bureau Veritas Project No. 135598.18R000-001.086). According to the Survey:

Asbestos was identified within the following materials:

Material	Location	Percentage/Type*	Material Condition	Quantity	NESHAP Category
Drywall joint compound	Building #2036 Apt A and B and Building #2082 Apt B & C	3% Chrysotile	Intact	9,565 SF	RACM
Drywall texture		2% Chrysotile	Intact		RACM
Black sink mastic	Building #2036 Apt A and B and Building #2082 Apt C	2% Chrysotile	Intact	4 SF each	CAT II
Brown VFT and Mastic under carpeting	Building #2036 Apt A and B and Building #2082 Apt B	2% Chrysotile 3% Chrysotile	Intact	955 SF	CAT I CAT II
Mastic associated with multi-layered flooring under faux wood laminate flooring	Building #2036 Apt A and Building #2082 Apt B	2% Chrysotile 3% Chrysotile	Intact	655 SF	CAT L CAT II
Mastic associated with stair tread	Building #2082 Apt B	2% Chrysotile	Intact	12 SF	CAT II
Residual flooring mastic	Building #2082 Apt C	2% Chrysotile	Intact	460 SF	CAT II
Mastic associated with multi-layered flooring under 4 squares beige/gray peel and stick flooring	Building #2082 Apt B	5% Chrysotile	Intact	300 SF	CAT II

SUSPECT ASBESTOS CONTAINING MATERIALS

The following suspect asbestos containing materials were identified and found negative for asbestos:

Nelson Park Apartments – Building #2036 Negative Materials	
Drywall	Ceiling texture
Brown cove base and adhesive	White cove base and adhesive
White ceramic tile and mastic and grout	Cinder block and mortar
Brown marbled peel and stick tiles and adhesive	Carpet adhesive
HVAC Vibration gasket	Brick and mortar
Exterior window/door caulking	Blue 12" VFT with streaks and mastic
Tan 12" VFT w/streaks and mastic	Gray exterior caulking
Roofing shingles and tar paper	Blown-in insulation
Brick seam caulking and mortar	
Nelson Park Apartments – Building #2082 (partial)	
Gray sink mastic	Dark blue 12"VFT with streaks and mastic

Asbestos containing material (ACM) as defined by the EPA and OSHA are materials with an asbestos concentration of greater than 1% (>1%) as analyzed by polarized light microscopy (PLM). In addition, ACM is designated as follows for NESHAP compliance:

Friable Asbestos – material which can be crumbled, pulverized or reduced to powder by hand pressure, a.k.a. Regulated Asbestos Containing Materials (RACM)

Category I non-friable – includes resilient floor coverings, asphalt roofing products, gaskets and packings.

Category II non-friable – any non-friable ACM that is not Category I (i.e. transite siding material).

The above-listed results are not a comprehensive asbestos survey and should not be relied upon as such.

Additional ACMs and/or presumed ACMs may be located at the Project in areas not accessed by the inspector or because of limited sampling and analysis conducted as part of the screening. Therefore, additional inspection is recommended of any areas that may undergo renovation or demolition. Furthermore, initial or additional sampling may be necessary prior to disturbance of specific suspect/presumed ACMs.

Asbestos-containing materials have been presumed (PACM), or have been identified (ACM) at the Project by laboratory analysis of bulk samples. If ACM has been identified, the documentation should be utilized as part of this O&M Plan.

The basis for “assumed” determination is taken from the materials listed in Appendix G of the United States Environmental Protection Agency (USEPA) publication *Managing Asbestos in Place* (the “Green Book”), and from the OSHA Asbestos in Construction Standard (29 CFR 1926.1101). Therefore, all materials listed in the Green Book that were installed prior to 1989 are considered suspect with the exception of resilient flooring and associated mastics, asbestos-cement board (Transite), and some roofing materials. These materials are considered suspect regardless of installation date because they have not been banned by the USEPA.

Prior to conducting any maintenance work which may disturb any suspect ACMs (including, but not necessarily limited to those listed in the following three report subsections), the APM should determine whether any known or suspect ACM(s) will be potentially disturbed. The APM should review O&M Program records to determine whether all materials that may be disturbed have been adequately sampled and analyzed for asbestos content. If suspect ACM(s) will be potentially disturbed, the APM should arrange for sampling and analyses of the suspect ACM(s) prior to commencement of work. In lieu of sampling and analyses, suspect ACMs can be assumed to be and treated as asbestos-containing.

Determining whether any suspect ACMs will be disturbed by maintenance work, renovation, or demolition may be accomplished through review of previous inspection and sampling records (if available). However, if insufficient data is available, inspection and possibly sampling must be conducted by a properly trained and/or licensed APM, properly trained/licensed O&M personnel, or a properly certified and/or licensed asbestos consultant.

Sampling and analysis of suspect ACM materials should be done prior to repairs, renovation, or demolition activities that may cause a disturbance. Until sampled, these materials should be maintained in-place in good condition as part of the Operations and Maintenance Program. If these materials are damaged, they should be treated as friable materials.

Any identified asbestos-containing materials (in quantities greater than three square or linear feet) that are damaged should be repaired or removed by a licensed asbestos contractor in accordance with all applicable federal, state, and local regulations. Repair or removal should be supervised by an independent, third party industrial hygiene firm.

Generally, other types of ACMs/PACMs at the Project may include, but are not necessarily limited to the following:

- Vinyl flooring materials and associated mastics
- Roofing materials
- Wallboard – joint compound
- Spackling compounds
- Other mastics (i.e. carpet or ceiling tile)
- Caulking / Putties
- Cement Wallboard
- Sprayed-on or troweled –on acoustical
- Textured paints / coating
- Stucco
- Cement Siding
- Fireproofing
- Fire doors
- Fire blankets
- Fire curtains
- Chalkboards
- Vinyl Wall Coverings
- Ceiling tiles and Lay-in panels
- Decorative plaster
- Blown-in insulation
- Pipe insulation
- Pipe fitting insulation
- Duct or flue insulation
- Insulation seam sealants
- Heating and electrical ducts
- Flexible duct work connectors,
- Duct work taping cloth,
- Duct work mastic
- Boiler or tank insulation or insulation
- Electrical cloth
- Electrical panel partitions
- High temperature gaskets
- Cooling tower panels or other cement (Transite) panels/materials
- Elevator brake shoes and equipment panels
- Window glazing.

It is Bureau Veritas's opinion that Resilient Flooring materials, Mastics, asphalt roofing products, joint compound, and Transite materials installed at any time, as well as the remaining listed materials installed prior to 1989 should be considered suspect ACMs. Therefore, any such material applications located at the Project should be assumed to contain asbestos, (unless sampled and proven otherwise) and should be maintained in good condition, in accordance with this O&M Program.

Sampling and analysis of suspect/presumed ACM materials should be done prior to repairs, renovation, or demolition activities that may cause a disturbance.

7. O&M Program Implementation

7.1. Worker Training

The Owner shall, at no cost to the employees, institute a training program for the following employees:

- Employees who perform repair and maintenance operations where ACM/PACM is likely to be disturbed (Class III asbestos work).
- Employees who perform maintenance, custodial, or housekeeping activities during which employees contact, but do not disturb, ACM or PACM and activities to clean up dust, waste, and debris resulting from Class I, II, and III activities (Class IV asbestos work).

Training shall be provided prior to or at the time of initial assignment, and at least annually thereafter (for Class III work).

Any maintenance staff that may be expected to perform Class III and IV work shall receive training equivalent to the 16-hour Operations and Maintenance course developed by EPA for maintenance and custodial workers who conduct activities that will result in the disturbance of ACM/PACM. (Work Practices, worker protection and other guidelines necessary for completion of Class III work are not contained within this O&M Program and must be obtained upon training.) The training course shall include "hands-on" training in the use of respiratory protection and work practices. A 16-hour training course is required under most circumstances to meet this requirement. If duties are limited to activities such as changing of gaskets, a course of lesser duration may be sufficient. An annual refresher course of four hours is also required.

Although only a 16-hour course is required for employees conducting Class III, Bureau Veritas recommends that the acquisition of EPA accreditation under the Asbestos Hazard Emergency Response Act (AHERA) or state certification as an Asbestos Worker.

Training for maintenance, custodial, or housekeeping staff (performing Class IV work) shall consist of training equivalent in curriculum and training method to the awareness training course developed by EPA for maintenance and custodial workers who work in buildings containing ACM. The course shall include available information concerning the locations of ACM and instruction in recognition of damage, deterioration, and delamination of ACM. A two-hour initial training course and two-hour annual refresher course will meet this requirement.

OSHA asbestos regulations require that the Employer inform all employees of the availability of self-help smoking cessation program material. Upon employee request, the employer shall distribute such material, consisting of NIH Publication No. 89-1647, or equivalent self-help material, which is approved or published by a public health organization.

7.2. Visual Reinspection

A visual reinspection of the Project should be conducted by the APM or by properly trained O&M personnel immediately upon completion of APM training. One purpose of the reinspection is to identify all ACM, PACM, or hazardous conditions that may have been overlooked upon previous inspection (Oversights may have occurred due to lack of training or understanding). The reinspection should be conducted utilizing the **ACM Inspection Form** that is included in Appendix D.

Another purpose of the reinspection is to determine the need for **Notifications, Labeling, and Signage**. Based on the locations and conditions of ACMs and PACMs present at the Project, these activities may be recommended or required (see Sections 7.4, 7.5, and 7.6).

All records of inspection, notifications, etc. should be maintained within the permanent O&M Program files.

7.3. Initial Clean-Up/Abatement/Testing

The APM shall immediately address any damaged ACM/PACM conditions identified during any initial inspections or reinspections. Actions taken by the APM may be self-directed or based on consultation with Bureau Veritas or other consulting personnel. Appropriate response actions may be as simple as restricting access to affected areas of the Project to properly trained and/or protected personnel. Response actions may also include abatement (repair, removal, enclosure, etc.) of damaged material or hazardous conditions. Sampling of damaged materials may also be necessary prior to determination of appropriate response actions.

Damaged ACM/PACM conditions or any other evidence of an asbestos fiber release will be recorded on an Asbestos Fiber Release Episode Report Form (Appendix G). The form will be completed upon remediation of the condition.

All records of sampling, analysis, and abatement actions should be maintained within the permanent O&M Program files.

7.4. Notification

Building Personnel Notification

It is important to undertake an honest and open approach to the Asbestos notification procedure. People who are informed of the presence, location and condition of ACM/PACM in a building where they work, who understand that the mere presence of Asbestos is not necessarily hazardous to them, and who accept that Asbestos can often be managed effectively in place, can be very helpful to the owner or APM in eliminating or reducing hysteria on the part of other less informed building occupants.

This section is intended to comply with the Hazard Communication requirements of the OSHA Asbestos in Construction Standard (29 CFR 1926.1101(k)). Persons who use, occupy, or are affected by an area where ACM work will occur should be notified prior to the start of the work. OSHA regulations include mandatory notification of certain personnel prior to the performance of work regulated by OSHA. The APM shall notify the following persons of the presence, location and quantity of ACM at the work sites in their building and facilities:

- Prospective employers applying or bidding for work whose employees reasonably can be expected to work in or adjacent to areas containing ACM/PACM.
- Employees of the owner who will work in or adjacent to areas containing ACM/PACM (Maintenance and Custodial personnel).
- On multi-employer worksites, all employers of employees who will be performing work within or adjacent to areas containing ACM/PACM.
- Employers of employees (commercial tenants) who will occupy areas containing ACM/PACM.

Notification either shall be in writing, or shall consist of a personal communication between the APM and the person to whom notification must be given or their authorized representative. In either case, record of the notification shall be included in the O&M Program files.

Regardless of the format, the following information should be included with the notifications (also see the Example Notification Letter in Appendix E):

- ACM/PACM has been identified in the building and is located in areas where the material could be disturbed.
- The location and condition of the ACM/PACM, and the response that is appropriate for that condition.
- Asbestos only presents a health hazard when fibers become airborne and are inhaled. The mere presence of Asbestos within a building does not represent a health hazard.
- Do not disturb the ACM/PACM.
- Report any evidence of disturbance or damage of ACM/PACM to the APM.
- Report any dust or debris that might come from the ACM or PACM, any change in the condition of the ACM/PACM, or any improper action (relative to ACM/PACM) of building personnel to the APM.
- Cleaning and maintenance personnel are taking special precautions during their work to properly clean up any asbestos debris and to guard against disturbing ACM/PACM.
- All ACM/PACM is inspected periodically and additional measures will be taken if needed to protect the health of building occupants.

Personnel should be given information about

- The specific work to be performed,
- The work schedule, precautions being taken,
- What will be visible during the work, and
- Posted warning sign

Section 4 of the EPA Green Book includes information on occupant, tenant and worker notification of the presence of ACM that might be helpful to the APM.

If O&M work occurs frequently, and notification is needed, a general notice to affected personnel might be more convenient than notifying these personnel each time work occurs.

Federal, State and Local Notifications

The APM, his designee, or abatement contractor should file all notices required by federal, state and local regulations prior to the start of any O&M activities that are governed by these regulations.

Federal Notifications

Federal requirements for notification are set forth in the National Emission Standards for Hazardous Air Pollutants (NESHAP) rules and the EPA Worker Protection Rule. For demolition and renovation work, the latest NESHAP revisions are contained in 40 CFR 61.145 (a) and (b). A ten working day federal notification is required for renovation work if the combined amounts of regulated ACM (RACM - see glossary or NESHAP for definition) to be stripped, removed, dislodged, cut, drilled or similarly disturbed is over 260 linear feet (80 linear meters), 160 square feet (15 square meters) or 35 cubic feet (1 cubic meter) for any single project. EPA's NESHAP rules specifically warn that "single projects" cannot be subdivided into smaller projects in an attempt to avoid notification requirements.

Also, if the combined estimated quantities of RACM to be removed or stripped in individual non-scheduled operations during a calendar year (January 1 through December 31) exceeds the amounts listed above, a NESHAP notice must be submitted at least ten working days before the end of the calendar year (e.g. December 15) preceding the year for which notice is being given. A new written notice must be filed with the EPA if the start date for a project is revised (earlier or later) from the date filed in the original or a previous notice. A notice must be updated if the amount of asbestos affected changes by 20 percent or more.

If wetting of RACM during removal would unavoidably damage equipment or present a safety hazard, written approval from the EPA is required for alternative emission control methods (dry removal).

The NESHAP notification requirements for emergency renovation work are set forth in 40 CFR 61.145 (a) and (b). See NESHAP regulations for details on Federal notification requirements. Additional requirements might also be included in state or local regulations.

State and Local Notification Requirements

State and local notification requirements vary greatly. Many states and localities have notification requirements that are more stringent than the federal requirements. State and local requirements concerning permits for any repair or renovation work must be reviewed. State and local requirements must be complied with before work is scheduled and commenced.

7.5. Labeling

In order to inform Maintenance, Custodial, and other personnel of potential asbestos hazards, asbestos labeling and/or signage may be necessary at the Project. If easily damaged ACMs or PACMs are present in maintenance areas of the Project, labels should be affixed directly to the ACMs/PACMs or warning signs should be posted (as discussed in the following section). Easily damaged ACMs/PACMs include thermal system insulation (TSI) materials, surfacing material, or any other friable materials (also see Section 5 for a list of identified friable ACMs/PACMs).

If ACM/PACM labeling is conducted, then labels shall be affixed to all friable ACMs/PACMs within each mechanical or other building area that is not accessible to the public, but is accessible to maintenance, custodial, or contracted personnel.

Labels must also be affixed to all containers containing such products, including waste containers, regardless of signage.

Labels shall be printed in large, bold letters on a contrasting background.

Labels shall bear the following information:

**DANGER
CONTAINS ASBESTOS FIBERS
AVOID CREATING DUST
CANCER AND LUNG DISEASE HAZARD**

7.6. Signage

If signage is conducted at the Project in addition to or in-place of labeling, then warning signs should be posted at the entrance to mechanical rooms/areas in which employees reasonably can be expected to enter and which contain thermal system insulation material, surfacing ACM, or other friable ACM(s) (also see Section 6). This includes each mechanical or other building area that is not accessible to the public, but is accessible to maintenance, custodial, or contracted personnel. The APM shall post signs that identify the ACMs/PACMs which is/are present, its/their location, and appropriate work practices which, if followed, will ensure that ACM/PACM will not be disturbed.

No example of a mechanical room/area sign is provided since they can vary greatly, depending on the types of ACMs present.

The APM should also ensure that warning signs are posted by any asbestos removal contractors conducting work within their building(s). Warning signs that demarcate the regulated area during a response action shall be provided and displayed at each location where a regulated area is established. Signs shall be posted at such a distance from the regulated area that an employee may read the signs and take necessary protective steps before entering the area marked by the signs. These warning signs shall bear the following information:

**DANGER:
ASBESTOS
CANCER AND LUNG DISEASE HAZARD
AUTHORIZED PERSONNEL ONLY
RESPIRATORS AND PROTECTION
CLOTHING ARE REQUIRED IN THIS AREA**

7.7. Periodic Surveillance

Reinspection of all ACM/PACM in common and employee accessible areas should be conducted by the APM upon implementation of this Program (as discussed in Section 7.2) and at least every six months thereafter. In addition, Maintenance and Custodial Workers should be trained to conduct Asbestos surveillance on a periodic basis as part of their regular duties at the facility. Maintenance and custodial staff can conduct an Asbestos surveillance within common areas, employee areas, as well as other areas while conducting their regular job duties. Any damaged ACM/PACM identified by Maintenance and Custodial personnel shall be brought to the immediate attention of the APM.

Damaged ACM/PACM conditions or any other evidence of a asbestos fiber release will be recorded on an Asbestos Fiber Release Episode Report Form (Appendix G). The form will be completed upon remediation of the condition.

Every six months a member of the building staff or management should survey known ACM/PACM sites in the building and prepare a report indicating change in condition. The **ACM Inspection Form** in Appendix D can be utilized for the Periodic Surveillance.

During the semi-annual periodic surveillance, the APM or designee will personally observe the condition of all ACM/PACM at the facility and schedule the appropriate response action when necessary. If damaged ACM/PACM is identified, the APM will determine if the material can be effectively maintained in the Operations and Maintenance Program, or if based on the risk of asbestos fiber release, removal, repair, encapsulation or enclosure is warranted. In the event that new damage is noted, a licensed contractor should be engaged to correct the condition. The APM shall schedule repair of damaged material when necessary.

Any removal of ACM/PACM where the primary purpose is removal, as opposed to the cutting away of small amounts of ACM/PACM in order to access a building component, shall be considered asbestos abatement. Asbestos abatement (removal, repair, encapsulation and/or enclosure) at the facility shall be accomplished by a licensed asbestos contractor. In addition, any disturbance of ACM greater than that which can be contained in one standard sized glovebag or waste bag (which does not exceed 60 inches in length and width) shall be performed by a licensed asbestos contractor.

If the reinspection discovers no change in ACM/PACM conditions and all materials are in good condition, then this too should be included in the report. This report should then become part of the building's permanent O&M Program file, which must be kept for a minimum of 30 years.

It would be prudent for the APM to have the Project reinspected every three years by a licensed asbestos inspector³. The inspector will prepare a report on the ACM/PACM conditions and recommended response actions (if any). If remedial action is needed, then a licensed asbestos abatement contractor should be engaged to make the area(s) safe.

The APM should also consider having the Project inspected by a licensed asbestos inspector whenever building demolition, alteration, renovation, or modification work is planned, or for any work at the Project that will potentially disturb ACM or PACM.

The APM should consider contacting the asbestos consultant prior to initiating asbestos abatement work. Depending on the scope of work, detailed project specifications may be necessary to ensure satisfactory project completion. In addition, the latest EPA Asbestos Model Accreditation Plan requires that an EPA accredited Project Designer design any abatement activities that are beyond the scope of an O&M Plan.

7.8. Record Keeping

Record Keeping Required By This Program

All documentation required by this O&M Program shall be stored in permanent files for the life of the facility and must be transferred to successive owners of the facility. Records shall be maintained for all activities involving ACM/PACM and shall include: those records listed below, contractor and other personnel notifications and reports, and all other documentation of Program compliance.

The following records (as applicable) of O&M work should be retained in permanent files:

- ACM Inspection Forms (Appendix D), any reinspection reports, assessment reports, or sampling data
- A copy of the O&M Program (initial Program and all updated versions)
- The Work Practices Used
- Respiratory Protection Program
- Fiber Release Reports
- Job Request Forms for Maintenance Work (Appendix A)
- Maintenance Work Authorization Forms (Appendix B)
- Periodic Surveillance Reports
- Waste Tracking and Disposal (Appendix C)
- Air Monitoring Data
- Qualifications and Performance Records for Outside Contractors performing O&M work
- Verification of Employee Training (Appendix F)
- Data to rebut presumption that materials are asbestos-containing. For employers with employees engaged in asbestos-related work⁴, federal regulations require that the employer retain:
 - Personal Air Sampling/Exposure Monitoring Records
 - Historical Data (used to qualify for exemptions from OSHA's initial monitoring requirements)
 - Medical Records (for employees subject to a medical surveillance program)
 - Employee Training Records
 - Fit Test Records (for employees that use respirators)
- Data to rebut presumption that materials are asbestos-containing.

³This triennial inspection originally started with a EPA regulation pertaining to schools, but is now considered good practice for any facility.

⁴ This applies to Class III work, as well as to Class I and Class II work.

Under the Records Access Standard (29 CFR 1910.20), the Hazard Communication Standard (29 CFR 1910.1200 & 1926.59), and the asbestos in construction standard (29 CFR 1926.1101(n)), OSHA requires that employers provide to each employee his or her record of exposure and medical surveillance (if applicable). If necessary, refer to the OSHA Asbestos in Construction Rule (29 CFR 1926.1101), the EPA Worker Protection Rule (40 CFR 763 Subpart G) and/or the Green Book for details on Record keeping requirements. Note that state and local regulations may require that additional information be recorded and retained.

EPA recommends that building owners make available all written elements of the O&M Program to the building's O&M staff, as well as to tenants and building occupants, if applicable. Building owners are also encouraged to consult with their legal counsel concerning appropriate record keeping strategies as a standard part of their O&M programs.

Training Records

In accordance with the OSHA Asbestos in Construction Standard, the employer must maintain training records for one year beyond the last date of employment for each affected employee.

Inspection, Hazard Assessment And Abatement Records

Asbestos inspections, hazard assessments, abatement records and any other information concerning the identification, location and quantity of ACM/PACM shall be maintained by the APM for the life of the facility, and must be transferred to successive owners of the facility.

Objective Data

In accordance with the OSHA Asbestos in Construction Standard, objective data relied upon as part of an *Initial Exposure Assessment* or a *Negative Exposure Assessment* (See Appendix I, Glossary) must contain the following listed information. Note: an initial or negative exposure assessment should not be necessary unless Class I, II, or III⁵ Asbestos Work is performed.

- The product qualifying for exemption;
- The source of the objective data;
- The testing protocol, results of testing, and/or analysis of the material for the release of asbestos;
- A description of the operation exempted and how the data support the exemption;
- Other data relevant to the operations, materials, processing, or employee exposures covered by the exemption.

Objective data records shall be maintained for the duration of the employer's reliance upon such objective data.

Exposure Assessment Records

Exposure assessment records must include the following information. Note: an exposure assessment should not be necessary unless Class I, II, or III Asbestos Work is performed.

- The date of measurement;
- The operation involving exposure to asbestos that is being monitored;
- Sampling and analytical methods used and evidence of their accuracy;
- Number, duration, and results of samples taken;
- Type of protective devices worn, if any;
- Name, social security number, and exposure of the employees whose exposures are represented.

Exposure assessment records shall be maintained for at least 30 years past the end of employment.

Medical Surveillance Records

Medical surveillance records must include the following listed information. Note: Medical Surveillance of employees should not be necessary unless Class I, II, or III Asbestos Work is performed (see reference to footnote (4) on previous page for explanation).

- The name and social security number of the employee;
- A copy of the employee's medical examination results, including the medical history, questionnaire responses, results of any tests, and physician's recommendations;
- Physician's written opinions;
- Any employee medical complaints related to the exposure to asbestos;
- A copy of the information provided to the physician;

Medical surveillance records must be maintained for the duration of employment plus 30 years.

Transfer of Records

In accordance with the OSHA Asbestos in Construction Standard, if the employer ceases to do business and there is no successor employer to receive and retain records for the prescribed period, the employer shall notify the Department of Labor (DOL) at least 90 days prior to disposal and, upon request, transmit the records to the DOL.

⁵ Class III work has been previously defined in this document. Class I and Class II work is removal of ACM or PACM that is usually performed by accredited abatement contractors.

8. O&M Work Practices

8.1. Emergency Response Procedures

As long as ACM remains in the Project, a fiber release episode could occur if the ACM/PACM is inadvertently disturbed. Building staff will immediately report to the APM the presence of suspect asbestos-containing debris on the floor, water or physical damage to the ACM/PACM, or any other evidence of a fiber release. At the same time, an Asbestos Fiber Release Episode Report Form (Appendix G) will be initiated; and subsequently completed upon remediation of the condition.

The APM will conduct the following procedures:

- Evaluate the extent of ACM/PACM damage;
- Barricade contaminated areas against entry by unauthorized personnel;
- Isolate the contaminated area by sealing doors and vents with polyethylene sheeting and duct tape (or equivalent),
- Shut off or isolate the affected air handling system to prevent asbestos migration
- Post a warning sign outside the contaminated area; and
- Contact an Asbestos Consultant.

If extensive damage or delamination of ACM/PACM has occurred (e.g., greater than three square feet or three linear feet) consider total removal of the ACM by a pre-approved abatement contractor in the affected area(s), followed by replacement with a non-asbestos-containing material⁶.

8.2. Areas With Friable ACM

Friable ACM (for example, sprayed-on fireproofing on the structural element of the Project; and thermal system insulation [TSI] on the pipes, elbows, and/or boiler, and other vessels) will not be disturbed in quantities greater than three square feet or three linear feet by anyone other than the approved licensed abatement contractors. If any material dislodges because of the accidental disturbance or water leak, an Asbestos Consultant will be contacted as soon as possible after the area is secured. The Asbestos Consultant will contact an approved abatement contractor to respond to the emergency.

8.3. Areas With Non-Friable ACM

Non-friable ACM (for example, floor tile, mastic, and cementitious asbestos panels [e.g., Transite]) typically release fibers only when damaged or disturbed. Fiber releases can occur when workers drill, cut, abrade, break, or saw vinyl asbestos floor tile or any other non-friable material. General cleaning and maintenance, however, will not damage the material. USEPA has instituted recommended guidelines that should be followed by the building staff when stripping wax or finish coat from asbestos-containing flooring (see section 8.5).

8.4. Common Maintenance Activities Impacting ACM

Some examples of maintenance activities performed in specific locations, which may impact suspect or confirmed ACM are listed below. This work must be performed by taking the proper care and precautions, so as to not disturb the ACM.

Examples of Maintenance Activities Which May Potentially Impact ACM/PACM

- Maintaining Thermal Pipeline System
- Repairing Leaking Pipe Fittings
- Removal of Overlay Carpeting; Buffing
- Sanding or Grinding Floor Tiles
- Duct Riser Repair or Maintenance
- Accessing Columns or Walls, Repairing Light Fixtures
- Access to Above Suspended Ceilings
- Changing Fluorescent Light Bulbs

As required by applicable Federal, State and/or local laws and regulations, the APM will inform employees about the location and physical condition of ACM/PACM that may be disturbed. In addition, common safety practices have been included in Appendix H at the end of this document.

⁶ It would be prudent of the APM to have representative samples of the new material tested for asbestos content prior to installation (refer to section 6 of this document for a list of PACMs).

8.5. Guidelines for Removing a Finish from Asbestos-containing Flooring

1. **PROPERLY TRAIN STAFF.** Custodial or building staff who strip floors will be trained to operate the machines and pads and use floor care chemicals properly and safely
2. **AVOID STRIPPING FLOORS.** Stripping of floors will be done as infrequently as possible, perhaps once or twice a year or less, depending on circumstances. The frequency will be carefully considered when floor maintenance schedules or contracts are written or renewed.
3. **FOLLOW APPROPRIATE WORK PRACTICES.** Custodial or building staff who strip floors will follow appropriate work practices, such as those recommended here, under informed supervision. Directions from floor tile and floor wax product manufacturers on proper maintenance procedures will be consulted.
4. **STRIP FLOORS WHILE WET.** The floor will be kept adequately wet during the stripping operations. DO NOT perform dry stripping. Prior to machine operation, an emulsion of chemical stripper in water is commonly applied to the floor with a mop to soften the wax or finish coat. Stop stripping when the old surface coat is removed. Over-stripping can damage the floor and may cause the release of asbestos fibers. DO NOT operate a floor machine with an abrasive pad on unwaxed or unfinished floors. After stripping and before application of the new wax, the floor will be thoroughly cleaned while wet.
5. **RUN MACHINE AT SLOW SPEED.** If the machine used to remove the wax or finish coat has variable speeds, it will be run at slow speed (about 175-190 rpm) during the stripping operations.
6. **SELECT THE LEAST ABRASIVE PAD POSSIBLE.** USEPA recommends that the machine be equipped with the least abrasive pad possible to strip wax or finish coat from asbestos-containing floors.

NOTE: Improperly removing asbestos-containing floor coverings could result in the release of high levels of asbestos fibers. USEPA *recommends* that you leave asbestos-containing floor covering in place, provided the material is in good condition. However, proper maintenance procedures, such as those previously outlined, should always be followed.

8.6. Cleaning

Cleaning up within specific areas of the Project is one of the primary objectives of the O&M Program. The APM shall retain a licensed asbestos abatement contractor to conduct initial cleaning in areas of the Project where damaged ACM/PACM are present as soon as the O&M Program is in place and before the initiation of any response action.

All cleaning activities are to be recorded and included in the O&M manual.

The licensed asbestos abatement contractor will also conduct subsequent minor repair and routine maintenance.

Initial Cleaning

When damaged ACM/PACM is present, the asbestos abatement contractor must HEPA vacuum and, if possible, wet clean all areas in the immediate vicinity. This includes cleaning all surfaces, such as shelves, walls, light fixtures, equipment housing, and exterior of ducts, with damp cloths or a HEPA vacuum.

All mop heads, damp cloths, liquid wastes, debris, filters, or vacuum bags must be disposed as asbestos-contaminated waste.

Periodic Cleaning

The determination of when/where periodic cleaning is needed is based on the rate of dust buildup. This determination will be made as part of the periodic inspection. If cleaning is necessary, a pre-qualified licensed asbestos abatement contractor will clean the areas.

The abatement contractor shall remove any debris found near damaged ACM using a HEPA vacuum or wet methods. The contractor shall HEPA vacuum and/or steam clean all carpets in rooms with damaged ACM and wet wipe all surfaces in the area. If steam cleaning is used, the liquid waste generated during the process must be disposed as asbestos-contaminated waste. The contractor must dispose of debris, filters, and/or vacuum bags as asbestos-contaminated waste.

8.7. Work Practices For Maintenance Activities

Before conducting any maintenance or repair work that will damage or disturb ACM, the APM shall inspect the area to update and determine appropriate action(s). Whenever the potential for release of asbestos fibers from ACM exists (for example, sanding floor tile, repairing a pipe leak, or installing conduit above a suspended ceiling), an outside asbestos abatement contractor, will perform the work procedures in the aforementioned sections.

Basic O&M procedures to minimize and/or contain asbestos fibers may include wet methods, use of mini-enclosures, use of portable power tools equipped with special local ventilation attachments, and avoidance of certain activities, such as sawing, sanding, and drilling ACM.

NOTE: During O&M procedures, personal air monitoring should be performed. In addition, all asbestos waste (generated during these activities) must be handled in accordance with all local, state, and federal requirements.

Maintenance activities can be divided into three categories with regard to their potential for disturbing ACM:

Contact with ACM Unlikely - In-House Personnel

Maintenance activities or repairs that can be performed without contacting or disturbing the ACM/PACM require little more than normal care and good workmanship and can be performed by in-house personnel. These include, but are not limited to:

- Repairing non-ACM insulated pipes or valves without disturbing other ACM/PACM.
- Routine cleaning activities

All surfaces will be isolated to remove any settled fibers in the event that ACM/PACM are disturbed. If more than three square feet or three linear feet are disturbed, then a licensed abatement contractor should be called.

Contact with ACM Not Likely But Possible

Maintenance activities or repairs that may have the potential to cause accidental disturbance of ACM/PACM require some precautions. This work may be performed by trained maintenance staff only, since it requires information and guidance (for example, additional training and worker protection procedures) beyond the scope of this O&M Program. For this work to be completed, proper precautions must also be instituted to minimize the potential ACM disturbance. For example, special cleaning, possibly area isolation and respiratory protection, may be needed if the chance of disturbance is likely. Activities that fall into this category include, but are not limited to:

- Working on a fixture near thermal system ACM;
- Working on a fixture above suspended ceilings where asbestos-containing sprayed-on fireproofing or troweled-on acoustical material is present;
- Installation of telecommunication or electrical conduits above suspended ceiling; and
- Repairing of a pipe that is not insulated with ACM but will disturb ACM on nearby pipes.

Contact with ACM Likely Or Intended

Maintenance activities or repairs that involve intentional manipulation or disturbance of ACM require special work practices when done on a large scale (greater than three square or linear feet). A licensed abatement contractor must remove ACM before in-house personnel can perform their duties. The asbestos contractor must use personal protective equipment, including respirators and Tyvek suits. In addition, personal air monitoring, and other procedures must be followed when ACM is disturbed under these conditions.

Typical activities include but are not limited to:

- Removing a thermal system insulation to repair a pipe leak or replace a valve; and
- Removal of surfacing ACM to install new conduits or pipe braces.

Prior to performing any maintenance activities that will disturb ACM, the APM shall contact an Asbestos Consultant to provide area air monitoring before, during, and after the ACM disturbance, if necessary.

NOTE: **Under no circumstances will any in-house employee perform this type of abatement work, unless s/he has successfully completed an EPA-approved asbestos worker course, and an asbestos supervisor is present during the project.**

8.8. Special Work Practices For Planned Renovation Work

Future renovations may involve disturbing ACM or PACM and may also uncover building materials that were previously hidden and may contain asbestos. Work, such as moving walls, adding wings, and replacing heating or air-conditioning systems may involve breaking, cutting, or otherwise disturbing ACM.

All parties must be aware of potential ACM disturbance early in the project planning stage to determine appropriate actions. Partial or full removal may be necessary before renovation.

An independent Asbestos Consultant should develop guideline specifications or work plans in accordance with USEPA, OSHA, state, and local regulations, if necessary, for use by the asbestos abatement contractor.

An Asbestos Consultant shall ensure that the asbestos abatement contractor perform all work in compliance with applicable federal, state, and local laws and regulations. The Asbestos Consultant can assist in maintaining records of work, including copies of the specifications and closeout documentation.

9. Recommended O&M Work Control/Permit System

Introduction

The Work Control/Permit System described in this section is intended to assure communication between the APM, the maintenance staff, and outside contractors who may have been hired to work in the facility. This system is not designed to address all sizes and varieties of jobs that may cause potential asbestos disturbance. The forms and procedures utilized in this section and in this O&M Program may be more burdensome than is necessary for smaller jobs, depending on the types of ACMs or PACMs that are present at the Project.

Determination of which forms and Work Control/Permit System to use will be Project and situation dependant. Guidelines for which forms and procedures to use for typical or emergency work requests should be made by the APM at each Project. Subsequently, these guidelines should be outlined in interoffice correspondence or personnel training documents. Hence, the APM can develop Project specific guidelines for the types of activities that require completion of O&M forms, and guidelines for which forms to use for different materials and situations. Therefore, the guidelines for O&M Program procedures at each Project can be made by the APM, or through consultation with the Asbestos Consultant.

Work Control/Permit System

The APM or a designee should review O&M general procedures with all workers who will perform activities in the presence of ACMs. Workers should be notified to consult with the APM or the APM's designee if they have any questions, if any problems occur, if ACM/PACM disturbance may occur, or if it appears to the workers that additional precautions might be necessary to safely perform their duties.

This section describes one suggested method of O&M work tracking and record keeping procedures utilizing the attached and appended checklists, figures, and forms. A checklist (Figure 1) that guides the APM through necessary decisions and use of the appended tracking forms is provided below. A flowchart illustrating the typical decision scenarios and use of the appended forms is shown in Figure 2. The process of controlling, tracking, and record keeping for O&M work in order to minimize improper ACM disturbance can be achieved using forms contained in this O&M Program. Use of the forms contained in this O&M Program is summarized below. The numbered discussions presented below correspond to the numbers presented on the Checklist and the Flowchart.

- (1) As part of maintenance and custodial personnel training, O&M personnel are informed of the locations and conditions of ACMs, suspect ACMs, and PACMs. Personnel are also informed of routine custodial activities that can be performed without pre-authorization from the APM. Personnel are trained to recognize ACMs, suspect ACMs, and PACMs and recognize conditions that require review by the APM prior to commencement of work. That is, the APM sets guidelines for all other building personnel regarding work that can be performed without initiating the O&M Work Control/Permit System (completion of a **Job Request Form** initiates the System). The APM also sets guidelines regarding the types of work or materials disturbance that require initiation of the System. Guidelines may be different for each Project, dependant on the variety of ACMs, suspect ACMs, and PACMs as well as conditions present at each Project. Guidelines are set by the APM for each Project.

A **Job Request Form** (Appendix A) should be completed prior to maintenance work or other O&M activities, as the necessity for form completion is determined by the APM and subsequently prescribed by the O&M Program. The **Job Request Form** should be initiated by maintenance or custodial personnel for work that could disturb ACM. If the required work has been performed in the past, it might not be necessary to complete an **APM Checklist** for each O&M activity. Past checklists can be reused for determination of procedures.

- (2) Before commencing renovation, remodeling, demolition, repairs, or maintenance activities that may disturb ACM, suspect ACM, or PACM, an inspection for the presence of ACM must transpire. This shall include but not be limited to inspection of this Project's O&M Program to identify previously surveyed areas. The APM should review building inspection information to determine whether or not all suspect materials in the work area have been previously sampled and analyzed for asbestos content. The APM may need to inspect the area in which work will occur to determine the building materials that may be disturbed during the requested work. The APM should initiate an **APM Checklist** (Figure 1) and evaluate the work to be performed based upon the information on a completed **Job Request Form**, available survey and assessment data, and data on past O&M activities (if available). When reviewing data and completing the **APM Checklist**, the following should be determined:
- Whether the job requested is actually an asbestos O&M activity.
 - The category(ies) of ACM that might be encountered during the work (friable or non-friable; surfacing ACM, Thermal System Insulation (TSI) ACM, and/or miscellaneous ACM).
 - Whether an ACM/PACM disturbance is likely to occur.

All of the above information should be recorded on a **Maintenance Work Authorization Form** (Appendix B). If the APM determines that no ACMs, suspect ACMs, or PACMs are likely to be disturbed during the work described on the **Job Request Form**, the various forms are completed and signed, and the requested job is allowed to proceed.

- (3) If the APM determines that ACMs, suspect ACMs, or PACMs will be potentially disturbed during the requested work, then work cannot proceed without further action. If all building materials that will be disturbed have been tested during previous investigations, and it is known which materials are asbestos-containing and which materials are non-asbestos-containing, than the work can proceed without further investigation and/or testing. However, the APM should engage a licensed asbestos abatement company to abate (remove, encapsulate, or enclose) the known ACM so that no ACM will be disturbed during the renovation work.

- (4) If upon inspection of the work area, a material or area is identified which may be disturbed and has not been represented by previous survey and sampling efforts, then all such suspect ACMs should either be sampled by a licensed asbestos inspector and analyzed in accordance with EPA regulations, or be assumed to contain asbestos and treated accordingly. The APM shall employ the services of an environmental consultant or lab when the need for inspection and sampling services arises. A licensed asbestos inspector should be engaged to inspect the work area and sample any suspect/presumed ACMs that could be disturbed by the work.
- (5) The asbestos inspector's findings and sample analytical results will dictate whether asbestos abatement must be conducted prior to the initiation of work. If the inspector's report concludes that all materials to be potentially disturbed are non-asbestos-containing, the work described on the **Job Request Form** can proceed without further investigation or asbestos abatement. The APM completes and signs the **Job Request Form, Maintenance Work Authorization Form, and APM Checklist**.
- (6) If the inspector's report concludes that any of the materials to be potentially disturbed during the work is/are asbestos-containing, then the APM should engage a licensed asbestos abatement company to abate (remove, encapsulate, or enclose) the known ACM such that no ACM will be disturbed during the work. The APM should ensure proper licensure of all contractors, verify that all regulatory agency notifications are completed, and notify any building personnel that may be in the area of or disrupted by the asbestos abatement activities.

Depending on the scope of work, detailed project specifications may be necessary to ensure satisfactory project completion. In addition, the EPA Asbestos Model Accreditation Plan requires that an EPA accredited Project Designer design any abatement activities that are beyond the scope of an O&M Plan.

The APM should separately contract licensed asbestos air monitoring personnel to conduct air sampling during the asbestos abatement activities. The air monitoring company and the asbestos abatement company should not be affiliated, so as to avoid any conflicts of interest. Air monitoring is necessary to demonstrate that the work area or any portion of the building was not contaminated by the asbestos abatement work.

- (7) The APM or a designee should review work practices with the workers/contractors who will perform the work. Workers/contractors should be notified to consult with the APM or designated person if they have any questions during the work, if any problems occur, or if it appears to the workers that additional precautions might be necessary to safely perform the work. Copies of all pertinent information should be provided to asbestos abatement contractors, including any asbestos investigation/survey reports or laboratory results, asbestos abatement specifications, regulatory agency notifications, etc. Also, copies of information as listed on the **APM Checklist** and **Maintenance Work Authorization Form** should be provided to the asbestos abatement workers who will perform the asbestos work.
- (8) The APM or a designee should review the activities of asbestos abatement and air monitoring contractors during their work in order to protect the interests of the building owners and occupants.
- (9) Upon completion of any asbestos work, the APM should ensure that final reports are received from all contractors, including waste manifests which indicate the final destination of all asbestos waste. This information should be attached to the **Waste Tracking Form** (Appendix C). The APM should complete the **Waste Tracking Form**. This form and all investigation, laboratory, asbestos abatement, and air monitoring reports should be placed in the permanent O&M Program file.
- (10) Upon completion of asbestos abatement work, the APM or a designee should inspect the work area to ensure that asbestos abatement work is complete and that O&M work can proceed without disturbance of any ACMs, suspect ACMs, or PACMs.
- (11) Once the APM or designee has confirmed that no ACMs will be disturbed by the O&M work described on the **Job Request Form**, the O&M work can proceed. All of the activities leading up to initiation of O&M work (the above described steps) should be summarized on the **Maintenance Work Authorization Form**. This form, the **Job Request Form**, and the **APM Checklist** should be completed, signed, dated, and placed in the permanent O&M Program files. Copies of pertinent information, as listed on the **APM Checklist** should be provided to the O&M workers who will perform the actual O&M work.

The forms used in Appendices A, B and C of this O&M Work Practices Manual are reproduced from the EPA Green Book for use or guidance. Users of this O&M manual can use these documents as a basis for developing forms for their O&M Program and work permit process. It is recommended that O&M forms include the basic categories of information that are used on the Green Book forms.

**Figure 1: APM Checklist
(For O&M Work Control/Permit System)**

- ____ (1) Receive and review **Job Request Form** (Appendix A)
 Work to be performed: _____

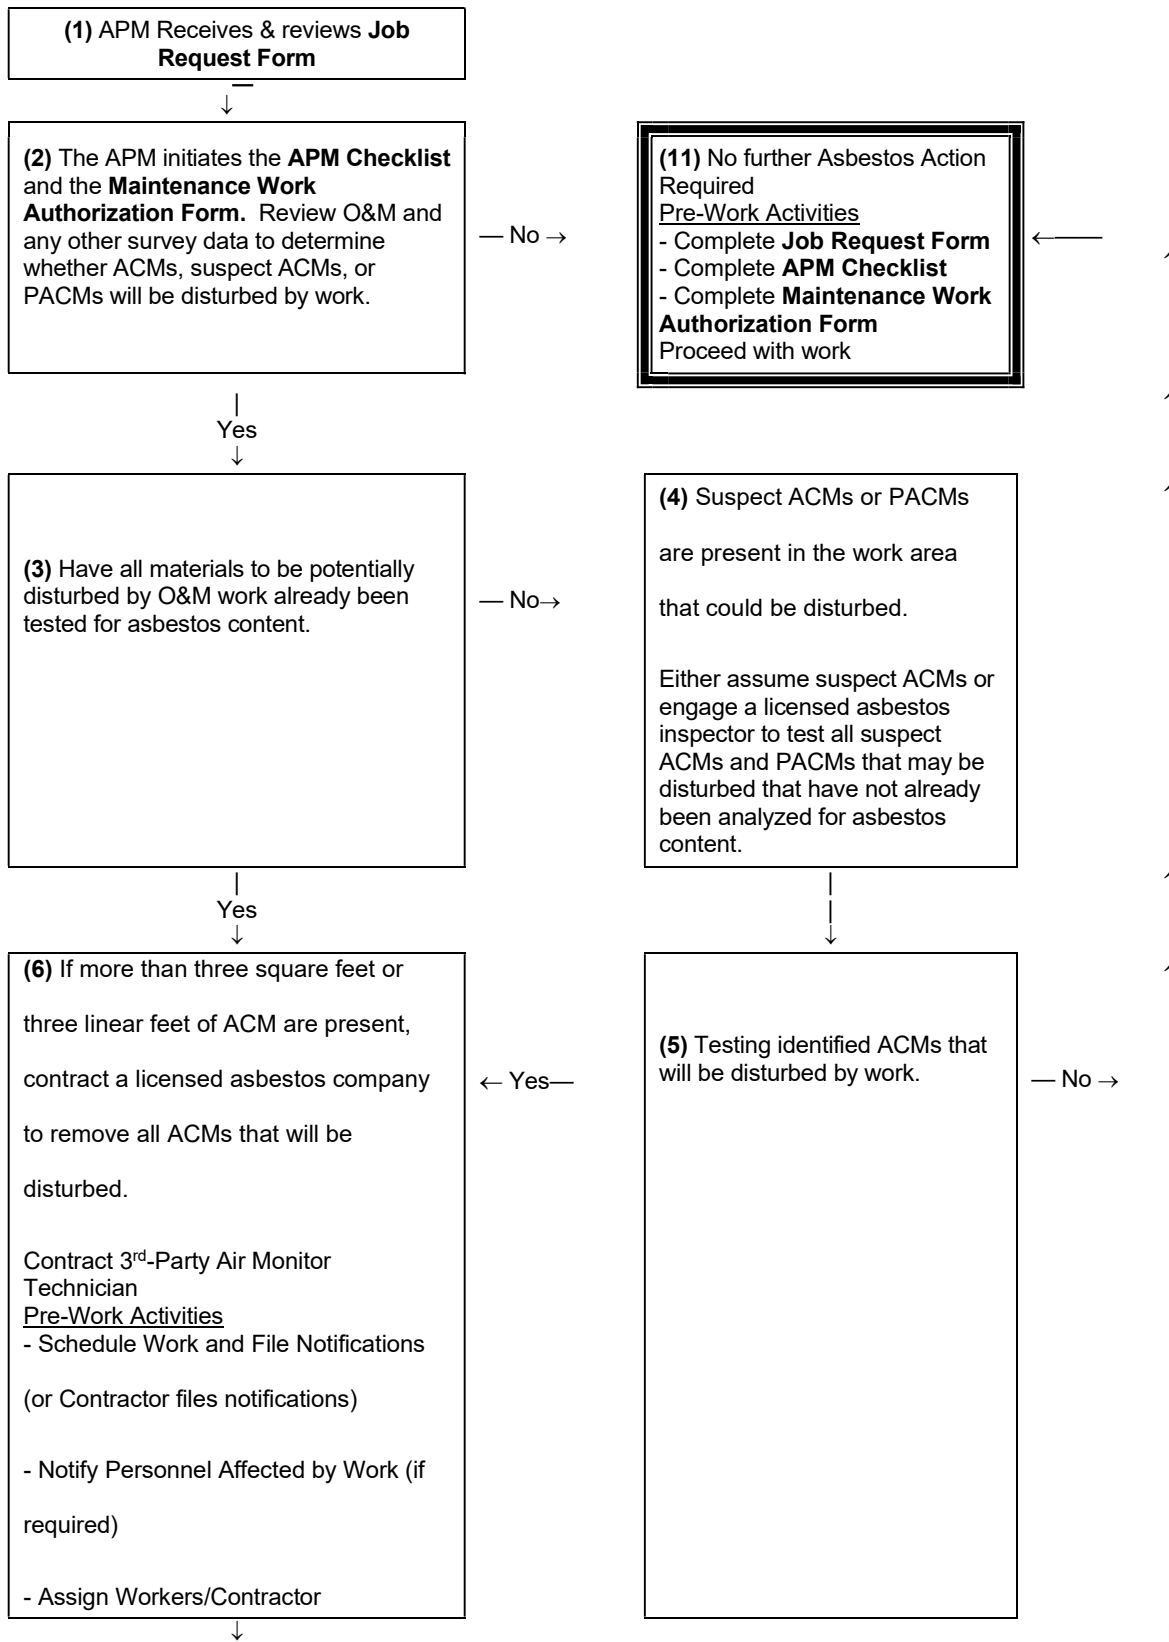

- ____ (2) Review or request survey data and inspect work area to determine whether ACM, suspect ACM, or PACM will be potentially disturbed by the O&M work. If none will be disturbed, then the O&M work can proceed without further investigation - go to number (11) below.
- ____ (3) ACMs, suspect ACMs, or PACMs are present in the work area and may be disturbed by the O&M work.
 _____ All Suspect ACMs in the work area have been tested for asbestos content, and more than 3 square feet or 3 linear feet of ACMs are present that must be abated (repaired, removed, encapsulated, or enclosed) - go to number (6) below.
- ____ (4) Suspect ACMs or PACMs are present that have not been tested for asbestos content.
- ____ (4) Either all suspect ACMs are assumed to be asbestos-containing (PACM), or a licensed asbestos inspector is engaged to survey the work area.
 _____ (5) The survey confirmed that no ACMs would be disturbed by O&M work – go to number (11) below.
- ____ (5) PACMs are present, or the survey identified ACMs that may potentially be disturbed by O&M work - go to number (6) below.
- ____ (6) Contract an asbestos abatement contractor to abate ACM/PACM prior to initiation of O&M work.
 _____ (6) Schedule work when area is not in use, or developed a plan to isolate area (if necessary).
- ____ (6) Federal, state and local notifications filed (if applicable).
- ____ (6) Notify personnel affected by work.
- ____ (6) Verify currency and get copies of asbestos abatement company’s licensure.
- ____ (6) Engage a third party licensed air monitoring technician to monitor asbestos abatement work.
- ____ (7) Provide copies to workers/contractor of:
 _____ **Maintenance Work Authorization Form**
 _____ General Procedure(s) or abatement specifications
 _____ Notifications
 _____ Schedule of work
- ____ (8) Work practices during asbestos abatement work were acceptable.
- ____ (9) File all survey, asbestos abatement, and air monitoring records in proper files.
- ____ (10) Reinspection of work area after abatement did not identify any ACMs, suspect ACMs, or PACMs.
- ____ (11) Completed forms filed in permanent O&M file.

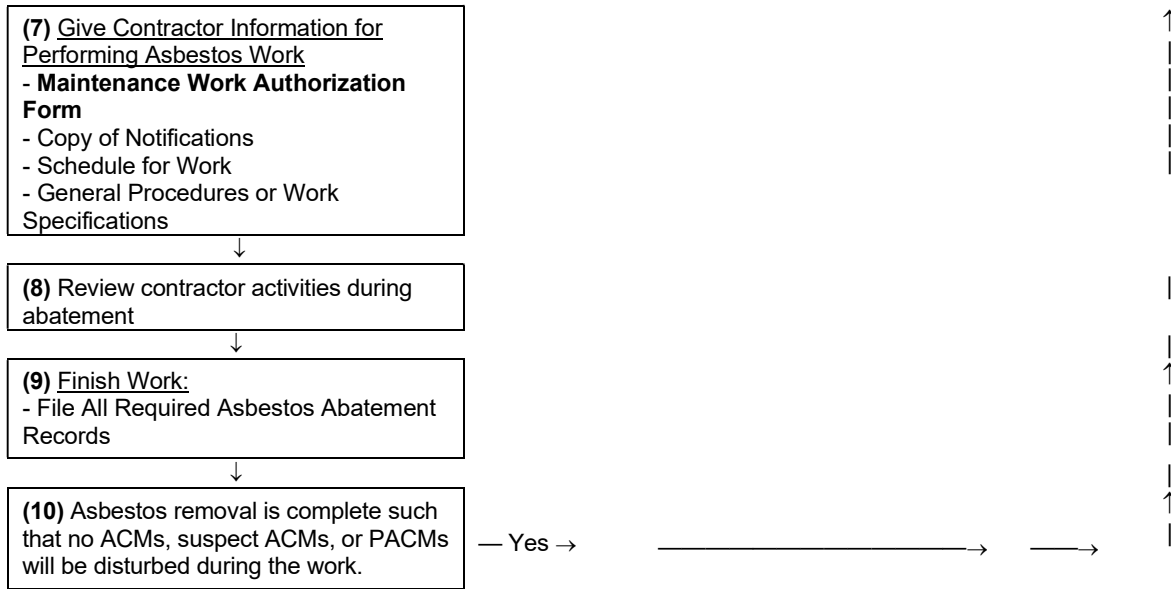

Signature: _____

Date: _____

Appendix A: Job Request Form for Maintenance Work

Job Request Form for Maintenance Work

Name: _____

Date: _____

Telephone No. _____

Job Request No. _____

Requested starting date: _____

Anticipated finish date: _____

Address, building, and room number(s) (or description of area) where work is to be performed: _____

Description of work: _____

Description of any ACM that might be affected. If known (include location and type): _____

Name and telephone number of requester: _____

Name and telephone number of supervisor: _____

Submit this application to: _____

(Asbestos Program Manager)

NOTE: A Job Request Form must be submitted for the types of maintenance work that the APM has prescribed. Types of work requiring a Job Request Form are listed by the APM and will vary per Project. A Maintenance Work Authorization Form must then be received before any work can proceed.

_____ Granted (Job Request No. _____)

_____ With conditions*

_____ Denied

*Conditions: _____

Appendix B: Maintenance Work Authorization Form

Maintenance Work Authorization Form

No. _____

AUTHORIZATION

Authorization is given to proceed with the following maintenance work: _____

PRESENCE OF Asbestos-containing material (ACM)

- _____ ACM is not present in the vicinity of the maintenance work.
- _____ ACM is present. but its disturbance is not anticipated: however, if conditions change, the APM will re-evaluate the work request prior to proceeding.
- _____ ACM is present. and may be disturbed.

Procedures if ACMs Are Present

The following work practices shall be employed to avoid disturbing asbestos, or abatement of ACM shall be arranged prior to commencement of maintenance work: _____

Personal Protection if ACMs Are Present

The following equipment/clothes shall be used/worn during the work to protect workers: _____

(manuals on personal protection can be referenced)

Special Practices and/or Equipment Required: _____

Signed: _____

Date: _____

(Asbestos Program Manager)

Appendix C: Waste Tracking Form

Waste Tracking Form

PART 1 - TO BE COMPLETED BY APM OR CONTRACTOR:

Maintenance Work Authorization No. _____

Work Location: Building: _____

Room # or Area: _____

Type of ACM Removed: _____

Quantity of Waste generated: _____ Bags

Other containers: _____

Waste transported to: _____

Transported by: _____

Tracking Form given to: _____

PART 2 - TO BE COMPLETED BY APM

Waste Properly Packaged & Labeled: Yes _____ No _____

EXCEPTIONS: _____

Waste Storage Location: _____

Waste Disposal Location: _____

Waste Shipment Records Received: _____

Date: _____

Signed: _____

(Asbestos Program Manager)

Date: _____

Asbestos-Containing Materials (ACM)
Inspection Form**

ACM/PACM Inspection Table				
Material Description	Location	Approx. Quantity	Condition	Response Action
SF = Square Feet LF = Linear Feet		* = Assumed ACM		

Appendix E: Example Notification Letter

ASBESTOS NOTICE TO TENANTS OF:

Project Name: _____

Tenant: _____

In response to an environmental assessment that identified **Asbestos-Containing Materials (ACMs)** and/or **Presumed Asbestos-Containing Materials (PACMs)** at the building(s), we have implemented a written Asbestos Operations and Maintenance (O&M) Program. This O&M Program is designed to maintain all asbestos in the building(s) in good condition and prevent conditions that could cause exposure to tenants and employees. Asbestos only presents a health hazard when fibers become airborne and are inhaled. The mere presence of ACM does not represent a health hazard. All ACM is inspected periodically and additional measures are taken if needed to protect the health of building(s) occupants. Cleaning and maintenance personnel are taking special precautions during their work to properly clean up any asbestos debris and to guard against disturbing ACM.

In accordance with our O&M Program, the building(s) has been inspected for friable (easily crumbled) and non-friable materials which contain asbestos. Friable and non-friable **ACM** and **PACM** that is present in the tenant occupied or common areas of the building include the following:

Material Description	Location
Friable Materials	
Non-Friable Materials	

Appendix F: Verification of Employee Training

Verification of Employee Training

Employee Name: _____

Social Security #: _____

Position: _____

Training Provider: _____

Address: _____

Appendix H: General Safety Considerations

General Safety Considerations

(This section is reprinted from Appendix D of the EPA's White Book for use by personnel performing O & M activities.)

Ronald L. Stanevich

NIOSH Division of Safety Research

This guide was primarily developed to provide recommendations concerning worker respiratory protection within the asbestos abatement industry. However, employers must not lose sight of the safety hazards their employees are exposed to in performance of their work. Asbestos abatement operations can take place in a variety of industrial, commercial and public settings. Each has unique potential safety hazards that the employer must control. However, nearly all abatement operations have some common safety hazards. With proper job planning and supervision, the employer can control both the health hazards and the safety hazards faced by their workers. The more common safety hazards associated with abatement operations and general recommendations to control them are discussed below. Sources for more specific safety information are listed to supplement and support the applicable OSHA regulatory standards.

I. Elevated Work Surfaces

The nature of asbestos abatement tasks usually requires workers to work from ladders, scaffolds, manlifts, or other elevated surfaces, which creates the potential for fall injuries. Slips and falls from ladders, scaffolds, and other elevated surfaces result in a major portion of the construction industry injuries. Many of these can be prevented by implementing a few control measures:

A. General

- (1) Avoid use of makeshift work platforms by providing portable ladders and scaffolds.
- (2) Ensure that job-built elevated work surfaces are inspected by a competent person other than the individual who erects it.
- (3) Avoid working from elevated surfaces where possible. Consider use of wands for spraying amended water or scrapers with extended handles.

B. Ladders

Eighty percent of ladder-related accidents result from improper use or application.

- (1) Workers should face the ladder when climbing up, down, or working from it.
- (2) Workers should not carry objects in their hands while ascending or descending ladders. While working from a ladder they should hold on with at least one hand.
- (3) Ladders should not be used as a substitute for planks, runways, or walkboards.
- (4) Ladders should be maintained in good condition. Defective ladders should be destroyed so that no one uses them by mistake.
- (5) Ladders should have safety feet in good condition to keep the ladder from slipping and cutting through polyethylene floor covers.
- (6) Ladder rungs/steps should be kept free of contaminants such as amended water and buildup of asbestos waste.
- (7) Employees should work no higher than the fourth step/rung from the top of the ladder.
- (8) Employees should not attempt to "reach" distant objects from a ladder; other platforms should be used.
- (9) Wood or fiberglass ladders should be provided to help control exposure to electrical hazards.
- (10) Employees should not straddle the space between a ladder and another object.
- (11) Employees should make a visual inspection of ladders before each shift.

C. Scaffolds

Falls from scaffolds result in about 2,000 injuries per month in the United States. These can be reduced by

- (1) providing guardrails around the perimeter of the work surface regardless of scaffold height
- (2) securing scaffold decks against slippage
- (3) keeping scaffold uprights vertical and pinned together when stacked
- (4) ensuring vertical members are braced to keep the scaffold plumb and level
- (5) decking the entire top portion of the work surface in lieu of using minimum planking dimensions
- (6) extending planks at least 6" (150 mm) over their support and cleating or restraining them from movement
- (7) ensuring that manufacturer built-in ladders are in good condition
- (8) maintaining mobile scaffold casters in good condition with position locking devices secured when employees are working from the scaffold
- (9) keeping mobile scaffolding height less than four times the minimum base dimension and with adequate cross-bracing
- (10) never interchanging scaffolding pans from different units
- (11) never using defective scaffolding
- (12) designating only "Competent" persons to perform scaffolding repairs.

II. Electrical Hazards

Asbestos abatement is often related to renovation or remodeling activities. Normally the equipment, machinery, overhead lighting fixtures, and auxiliary furnishings are removed to facilitate the abatement work. However, it is becoming more common that industrial and commercial buildings remain partially occupied while abatement operations are performed. In either situation, the abatement operator must take positive actions to protect employees from accidentally coming into contact with energized electrical circuits.

A. General

- (1) Perform a pre-work walk-through of the abatement area to look for pre-existing electrical hazards involved with the work.
- (2) De-energize as many circuits as possible.
- (3) Verify that the circuits have been de-energized with a "Field Current Sensing Device" circuit tester. Either lock out/tag out all de-energized circuits to prevent them from accidentally being energized.
- (4) Use non-conductive tools such as scrapers and vacuum attachments made of wood, plastic, or rubber.
- (5) Provide workers with non-conductive rubber boots and/or gloves when work must be done around energized wiring or equipment.

- (6) Prohibit accumulation of puddles of water on the floor. Workers should be trained in the intelligent use of amended water. No water should be used around energized circuits.

B. Permanent Building Circuitry

- (1) Ensure that all permanent circuits are provided with a grounding system. This can be determined with a portable ground tester.
- (2) Ensure that electrical outlets are tightly sealed and taped to avoid water spray.
- (3) Determine what equipment must remain energized during the abatement process.
- (4) Insulate or guard energized equipment and Wiring from employee contact and other conductive objects.
- (5) Avoid damaging permanent building wiring during the work.
- (6) Consider dry removal methods in the vicinity of electrical equipment which must remain energized.

C. Temporary Power

- (1) All temporary circuits provided by the abatement operator must be provided with a grounding system and protected by ground fault circuit interrupters.
- (2) Avoid stringing temporary wiring across floors
- (3) Elevated wiring should not be fastened with staples, nails, or wire.
- (4) Use care not to damage the wiring insulation during Installation or abatement work.

D. Electrical Cords and Tools

- (1) Provide extension cords which have a ground conductor.
- (2) Ensure that cords are not damaged, contain no splices, and that the grounding lug on the male plug is intact.
- (3) Position extension cords to eliminate stumbling/tripping hazards and to protect them from damage by moving scaffolds.
- (4) Provide electrical tools which are either grounded or of the double-insulated type
- (5) Use shatterproof, guarded bulbs and heavy duty wiring for temporary lighting.
- (6) Where plugs enter receptacles, ensure that the connection is protected by use of duct tape or by other means.

Data Sheet #515

National Safety Council

444 North Michigan Avenue

Chicago, Illinois 60611

III. Housekeeping

Asbestos abatement operations present continuous housekeeping problems. The accumulation of asbestos and other debris on polyethylene-covered floors create employee slipping and tripping hazards. It is essential that accumulation of such debris be bagged and removed from the floor as soon as possible. Even though this activity may initially require more effort, it will make final cleanup easier and the work area safer.

Supervisors Safety Manual

National Safety Council

444 North Michigan Avenue

Chicago, Illinois 60611

IV. Emergency Planning

The abatement operator should develop emergency procedures for fires or severely injured employees. Since abatement work areas must be sealed off, thereby blocking normal exits. The operator must familiarize the workers with procedures for safe exit in case of fire. Furthermore, the operator should develop plans for obtaining emergency aid in case of severe employee injury. The plans should be compatible with decontamination procedures yet provide for quick medical aid.

Appendix I: Glossary

Glossary

Acoustical Plaster Sound absorbing finishing material mill-formulated for application in areas where a reduction in sound reverberation or noise intensity is desired. These materials usually are applied in a minimum thickness of ½" (13 mm). The finish material is applied over gypsum plaster, plaster brown coat or other base plaster. The surface material is usually friable and has a rough surface appearance.

Acoustic Tile Tile-shaped blocks of sound absorbent material used for ceilings or as wall facing. May be glued to substrate or laid in a rigid grid work.

ACM Asbestos-Containing Material (Asbestos-containing Building Material). Any material containing more than one percent asbestos.

ACBM ACM found in or on the interior of a school or other building.

Adequately Wet Adequately Wet means sufficiently mix or penetrate with liquid to prevent the release of particulates. If visible emissions are observed coming from asbestos-containing material, then that material has not been adequately wetted. However, the absence of visible emissions is not sufficient evidence of being adequately wet.

AHERA Asbestos Hazard Emergency Response Act. This regulation is intended for schools (typically K-12). However, it contains the inspection protocol that accredited asbestos inspectors use in all buildings.

AIA American Institute of Architects

Air Monitoring The process of measuring the fiber content of a specific volume of air.

Amended Water Water to which a surfactant has been added for use in wetting ACM to control asbestos fibers.

APM Asbestos Program Manager

Asbestos Chrysotile, amosite, crocidolite, tremolite asbestos, anthophyllite asbestos, actinolite asbestos and any of these minerals that has been chemically treated and/or altered.

Asbestos-Containing Waste Material Mill tailings or any waste that contains commercial asbestos and is generated by a source regulated under the NESHAP. This term includes filters from control devices, friable asbestos waste material, and bags or other similar packaging contaminated with commercial asbestos. As applied to demolition and renovation operations, this term also includes regulated asbestos-containing waste and materials contaminated with asbestos including disposable equipment and clothing.

Asbestos debris Pieces of ACBM that can be identified by color, texture, or composition, or means dust, if the dust is determined by an accredited inspector to be ACM.

Asbestos Hazard Emergency Response Act (AHERA) An EPA regulation published in the October 30, 1987 Federal Register covering asbestos-containing materials in schools. AHERA requires local education agencies to identify ACM in their school buildings, develop an asbestos management plan and implement this plan. An O&M program is one permitted response action, where appropriate.

Asbestos O&M Work Cleaning, maintenance, repair or renovation work involving asbestos-containing materials where the intent of the activity is not to remove asbestos. The NESHAP requires that the owner or operator of a demolition or renovation activity conduct a thorough inspection of the affected facility or part of the facility where demolition or renovation will occur.

Asbestos Program Manager (APM) A building owner or designated representative who supervises all aspects of the facility asbestos management and control program.

Breathing Zone A hemisphere forward of the shoulders with a radius of approximately 6" to 9" (150-250 mm).

Bridging encapsulant An encapsulant that forms a discrete layer on the surface of an in situ asbestos matrix.

CFR Code of Federal Regulations

Clerk-of-the-works A representative of the architect or owner who oversees construction, handles administrative matters, and ensures that the construction is in accordance with the contract documents.

Competent Person means, in addition to the definition in 29 CFR 1926.32 (f), one who is capable of identifying existing asbestos hazards in the workplace and selecting the appropriate control strategy for asbestos exposure, who has the authority to take prompt corrective measures to eliminate them, as specified in 29 CFR 1926.32(f): in addition, for Class I and Class II work one who is specially trained in a training course which meets the criteria of EPA's Model Accreditation Plan (40 CFR part 763) for supervisor, or its equivalent and, for Class III and Class IV work, who is trained in a manner consistent with EPA requirements for training of local education agency maintenance and custodial staff as set forth at 40 CFR 763.92 (a)(2).

Compliance Instruction (Compliance Directive) Instruction issued by OSHA to establish policies and provide clarification to ensure uniform enforcement of OSHA standards.

Concealed Suspension or Concealed Spline Ceiling System Presents a monolithic ceiling surface, unobstructed by the cross-hatching of exposed grid members. Tiles are typically 12" x 12" (300 x 300 mm) or 12" x 24" (300 x 600 mm) with slots or kerfs cut into the edges of tiles for the purposes of accepting flat or "T" splines to support the tiles.

Confined Space A space that has limited openings for entry and exit, unfavorable natural ventilation and/or a space not designed for continuous worker occupancy. Examples include boilers, furnaces, pits, septic tanks, manholes, silos and utility vaults.

Critical Barrier One or more layers of polyethylene taped in place over openings into a work area. Openings to be covered include doors, windows, diffusers, and any other opening that could allow outside air into a work area.

CSRF Construction Sciences Research Foundation

Decorative Acoustic Finish: Finishing material mill-formulated and spray applied up to about 3/8" (10 mm) thick over gypsum wallboard. Material has a rough surface and is similar in appearance to acoustic plaster but is not designed for sound absorption.

Delamination Separation of one layer from another.

Disposal Bag Properly labeled 6 mil (0.15 mm) thick (or thicker) leak-tight plastic bags used for transporting asbestos waste from work and to disposal site.

Drop Cloth A layer of polyethylene on the floor of a work area to protect the floor below from contamination and to facilitate the clean-up of dust or debris generated during the work.

EJCDC Engineers Joint Contract Documents Committee

EL See Excursion Limit

Encapsulant A material that surrounds or embeds asbestos fibers in an adhesive matrix, to prevent release of fibers.

Enclosure The construction of an air-tight, impermeable, permanent barrier around asbestos-containing material to control the release of asbestos fibers into the air.

EPA U.S. Environmental Protection Agency

Excursion Limit (EL) The OSHA term used to define a maximum airborne concentration of asbestos in fibers per cubic centimeter as averaged over a sampling period of thirty minutes.

Fiber Release Any uncontrolled or unintentional disturbance of ACM resulting in visible emission.

Fireproofing Material applied to structural elements or systems which provides increased fire resistance, usually serving no structural function. This material is typically applied using spray equipment.

Friable Asbestos (See "Regulated ACM").

Glovebag A polyethylene or polyvinyl chloride bag-like enclosure affixed around an asbestos-containing source (most often, TSI) so that the material may be removed while minimizing release of airborne fibers to the surrounding atmosphere.

HEPA Filter High-Efficiency Particulate Air Filter. Such filters are rated to trap at least 99.97% of all particles 0.3 microns (0.3 mm) in diameter or larger.

HMR Hazardous Material Rules under Dept of Transportation regulations.

Initial Exposure Assessment Prior to the start of any work that may disturb ACM/PACM, the APM shall perform an assessment to determine the airborne concentrations of asbestos to which employees may be exposed. This assessment must be based on air monitoring results obtained from breathing zone air samples that are representative of the 8-hour TWA and 30-minute short term exposures of each employee. In addition, this assessment shall include consideration of all observations, information or calculations which indicated employee exposure to asbestos, including any previous monitoring conducted in the workplace, or of the operations of the employee which indicate the levels of airborne asbestos likely to be encountered on the job.

MAP EPA Interim Final Model Accreditation Plan (MAP) for asbestos abatement worker training (40 CFR Part 763, Subpart E, Appendix C).

Medical Surveillance A periodic comprehensive review of a worker's health status. The required elements of an acceptable medical surveillance program are listed in the Occupational Safety and Health Administration standards for asbestos.

Mini-Enclosure An enclosure constructed of polyethylene sheeting used for small scale, short duration asbestos maintenance or renovation work. Mini-enclosures can be small enough to restrict entry to the asbestos work area to one worker. Appendix G to OSHA regulation 29 CFR 1926.58 discusses mini-enclosures and recommends that a change room be constructed contiguous to the mini-enclosure.

Miscellaneous ACM Interior asbestos-containing building material on structural components, structural members or fixtures, such as floor and ceiling tiles; does not include surfacing material or thermal system insulation.

NEA Negative Exposure Assessment

Negative Exposure Assessment A demonstration by the employer which complies with criteria in paragraph (f)(2)(iii) of 29 CFR 1926.1101, that employee exposure during an operation is expected to be consistently below the PELs.

Negative Pressure System A local exhaust system intended to prevent the escape of contaminated air to the surrounding environment. It utilizes HEPA filtration capable of maintaining a pressure differential with a lower pressure inside the Work Area than in any adjacent area. This system recirculates clean air and/or generates a constant flow of air from adjacent areas into the work area.

Negative Pressure Respirator A respirator in which the air pressure inside the respiratory-inlet covering is positive during exhalation in relation to the air pressure of the outside atmosphere and negative during inhalation in relation to the air pressure of the outside atmosphere.

NESHAP National Emission Standard for Hazardous Air Pollutants - EPA Rules under the Clean Air Act (40 CFR Part 61).

NIOSH The National Institute for Occupational Safety and Health, which was established by the Occupational Safety and Health Act of 1970. Primary functions of NIOSH are to conduct research, issue technical information, and certify respirators.

O&M Operations & Maintenance

Operations & Maintenance (O&M) Program A program of work practices to maintain ACM in good condition, ensure clean up of asbestos fibers previously released, and prevent further release by minimizing and controlling ACM disturbance or damage.

Occupied Area An area where personnel are present and are performing their normal activities intended for the area (such as in a typical office area from 8:00 to 5:00 p.m., Monday through Friday).

OSHA Occupational Health & Safety Administration.

PAPR Powered Air Purifying Respirator.

Penetrating Encapsulant An encapsulant that is absorbed by the in situ asbestos matrix without leaving a discrete surface layer.

PELs Permissible Exposure Limits.

Personal Air Samples An air sample taken with a sampling pump directly attached to the worker with the collecting filter and cassette placed in the worker's breathing zone. These samples are required by the OSHA asbestos standards and the EPA Worker Protection Rule.

PCM Phase Contrast Microscopy

Phase Contrast Microscopy (PCM) A method of analysis using a light microscope, used to find the concentration of airborne fibers. Does not distinguish among asbestos and other fibers. Used by OSHA to find personal exposures, and by EPA to find area levels for AHERA project clearance.

Plenum Any space to convey air in a building or structure. The space above a suspended ceiling is often used as an air plenum. This term is also used in the work practices to refer to spaces above a ceiling not used to convey air.

PLM Polarized Light Microscopy

Polarized Light Microscopy (PLM) A method of analysis using a light microscope to find the chemical or mineral types of samples, including the concentration of asbestos in bulk materials. Used by EPA for AHERA and NESHAP, and by OSHA to see if asbestos is involved in a project.

Project Representative Architect's representative at the project site who assists in the administration of the construction contract.

Protection Factor The ratio of the ambient concentration of an airborne substance to the concentration of the substance inside the respirator at the breathing zone of the wearer. The protection factor is a measure of the degree of protection provided by a respirator to the wearer.

RCRA Resource Conservation and Recovery Act.

RACM Regulated ACM

Regulated ACM (RACM) As defined by NESHAP in the November 20, 1990 Federal Register, **regulated asbestos-containing material (RACM)** means (a) Friable asbestos material, (b) Category I nonfriable ACM that has become friable, (c) Category I nonfriable ACM that will be or has been subjected to sanding, grinding, cutting, or abrading, or (d) Category II nonfriable ACM that has a high probability of becoming or has become crumbled, pulverized, or reduced to powder by the forces expected to act on the material in the course of demolition or renovation operations regulated by this subpart.

(Note: Regulated ACM is an EPA NESHAP concept. OSHA makes no distinction between friable and non-friable asbestos).

"Cutting" means to penetrate with a sharp-edged instrument and includes sawing, but does not include shearing, slicing or punching.

"Grinding" means to reduce powder or small fragments and includes mechanical clipping or drilling.

Friable asbestos material means any material containing more than 1 percent asbestos as determined using the method specified under AHERA (40 CFR Part 763, Sub-part F, Appendix A, section 1, Polarized Light Microscopy) that, when dry, can be crumbled, pulverized, or reduced to powder by hand pressure. If the asbestos content is less than 10 percent as determined by a method other than point counting by polarized light microscopy (PLM), verify the asbestos content by point counting using PLM.

Category I nonfriable asbestos-containing material (ACM) means asbestos-containing packings, gaskets, resilient floor covering and asphalt roofing products containing more than 1 percent asbestos as determined using the method specified under AHERA.

Category II nonfriable ACM means any material, excluding Category I nonfriable ACM. containing more than 1 percent asbestos as determined using the methods specified under AHERA, when dry, cannot be crumbled, pulverized, or reduced to powder by hand pressure.

Remove For Operations and Maintenance work on ACM, "remove" refers to the removal of ACM as needed to perform a maintenance or repair O & M activity.

Removal Encapsulant A penetrating encapsulant specifically designed to minimize fiber release during removal of asbestos-containing materials rather than for in situ encapsulation.

Repair Returning damaged ACBM to an undamaged condition or to an intact state so as to prevent fiber release.

Respirator A device designed to protect the wearer from the inhalation of harmful particulates.

Small-scale, Short-duration Term formerly used by OSHA to describe O&M work activities (in the previous OSHA construction standard). This term has been superseded by the work class definitions in the current OSHA standard.

Surfacing ACM Asbestos-containing material that is sprayed-on, troweled-on or otherwise applied to surfaces, such as acoustical plaster on ceilings and fireproofing materials on structural member, or other materials on surfaces for acoustical, fireproofing, or other purposes.

Survey An asbestos survey is what EPA calls an inspection in the AHERA regulation. It consists of a visual and tactile inspection of a building to identify, quantify and assess the accessibility and condition of the ACM and suspected ACM present.

Suspended "T" Bar Ceiling System A false or dropped ceiling composed of acoustic tiles laid into an inverted metal "T" bar grid frame suspended by wires from building framing members.

Surfactant A chemical wetting agent added to water to improve penetration, thus reducing the quantity of water required for a given operation or area.

TEM Transmission Electron Microscopy

Temporary Barriers One or more layers of 6 mil polyethylene installed to isolate a work area from other portions of a facility.

Thermal System Insulation (TSI) Thermal system insulation - asbestos-containing material applied to pipes, fittings, boilers, breeching, tanks, ducts or other interior structural components to prevent heat loss or gain or water condensation.

Time Weighted Average (TWA) In air sampling, this refers to the average air concentration of contaminants during a particular time period.

TSI Thermal System Insulation

Transmission Electron Microscopy (TEM) A method of analysis using an electron microscope, used to find and analyze the concentration of airborne or bulk asbestos fibers and structures. Distinguishes among asbestos and other materials; can detect smaller asbestos fibers than does PCM. Used by EPA to find area concentrations for large AHERA project clearance.

TSCA Toxic Substances Control Act

TWA Time Weighted Average.

Work Area The area where asbestos-related work or removal operations are performed which is defined and/or isolated to prevent the spread of asbestos dust, fibers or debris, and entry by unauthorized personnel.

Work Practices Procedures designed to be followed to avoid or minimize fiber release during activities affecting ACM.

RE: Asbestos Inspection at:
Nelson Park Apartments – Building 2036
1994 Maryland Avenue
Columbus, Ohio 43219
EMG Project No.: 135598.18R000-001.086

Dear Sir or Madam:

EMG, with the assistance of their subcontractor RiskNomics, LLC, has completed an Asbestos Inspection that included on site observations of the accessible areas of Nelson Park Apartments – Building 2036 (the “Project”). The inspection was conducted by Charles McKee, State of Ohio Asbestos Hazard Evaluation Specialist on December 13, 2018. The inspection consisted of a walk-through and visual observations of the accessible areas for suspect asbestos-containing materials (ACM), assessing the ACM for condition, friability, and quantity, and the collection of bulk samples.

A total of one-hundred forty-seven (147) bulk samples were analyzed to facilitate the inspection. The following materials were classified as ACM as the result of laboratory analysis:

- Drywall Joint Compound
- Drywall Texture
- Black Sink Mastic
- Brown Vinyl Floor Tile and Mastic under Carpeting
- Mastic Associated with Multi-Layered Flooring under Faux Wood Laminate Flooring
- Mastic Associated with Stair Tread
- Residual Flooring Mastic
- Mastic Associated with Multi-Layered Flooring under 4 Squares Beige/Gray Peel & Stick Flooring

The remainder of the materials sampled as part of this assessment were found to have no asbestos detected by laboratory analysis. Please refer to the attached report prepared by RiskNomics, LLC for additional information regarding the inspection.

Based on the results of the inspection, EMG offers the following recommendations:

- The results from this inspection should not be relied upon property-wide. The materials sampled, and the results presented above and in the attached report only apply to Building 2036. A comprehensive inspection compliant to requirements set forth in the National Emission Standard for Hazardous Air Pollutants (NESHAP) should be conducted prior to any renovation or demolition activities.
- If any ACMs are friable or will be rendered friable as a result of renovation or demolition activities in Building 2036, they should be removed by a State of Ohio certified asbestos abatement contractor prior to renovations. Any such renovation projects should be monitored by a qualified industrial hygiene firm for worker and environmental safety.
- Any ACMs that will not be disturbed should be managed in place using an O&M Program. As part of an O&M Program any contractors bidding on or performing work in the area should be made aware of the presence and locations of ACM's.

The independent conclusions represent our professional judgment based on information and data available to us during the course of this assignment. Factual information regarding operations, conditions, and test data provided by the Client or their representative has been assumed to be correct and complete. The conclusions presented are based on the data provided, observations, and conditions that existed on the date of the on site visit.

If you have any questions regarding this report, please contact me below at (800) 733-0660, Ext. 6454.

Sincerely,

Ron Melchior
Manager of Expanded Environmental Services
EMG

EXECUTIVE SUMMARY

On December 13, 2018, Mr. Charles R. McKee performed an asbestos inspection of Nelson Park Apartments Building # 2036, and a limited inspection of Building #2082, located at 1994 Maryland Avenue, Columbus, Ohio. The objective of the survey was to provide documentation to the Client consisting of a listing of readily accessible suspect asbestos containing materials, which may be impacted during upcoming renovation activities.

Inspection activities were performed by Charles R. McKee, a United States (U.S.) Environmental Protection Agency (EPA) Asbestos Hazard Emergency Response Act (AHERA) trained Asbestos Building Inspector, and State of Ohio Licensed Asbestos Hazard Evaluation Specialist. Copies of current Certifications can be found in Appendix B.

Inspection, sampling, material condition assessments, and analytical procedures for asbestos-containing building materials were performed in general accordance with the EPA's National Emission Standards for Hazardous Air Pollutants (NESHAP) - EPA Title 40, Code of Federal Regulations (CFR), Part 61 Subpart M (40 CFR Part 61, Subpart M), the EPA AHERA regulation (40 CFR Part 763), and the Federal Occupational Safety and Health Administration (OSHA) (29 CFR 1926.1101) guidelines, and the State of Ohio regulations. A total of one-hundred forty-seven (147) bulk sample materials were analyzed to facilitate the inspection.

Asbestos was identified within the following materials:

Material	Location	Percentage/ Type*	Material Condition	Quantity	NEHSAP Category
Drywall Joint Compound	Building # 2036 Apt A & B and Building # 2082 Apt B & C	3% Chrysotile	Intact	9,565 SF	RACM
Drywall Texture		2% Chrysotile	Intact		RACM
Black Sink Mastic	Building # 2036 Apt A & B and Building # 2082 Apt C	2% Chrysotile	Intact	4 SF Each	CAT II
Brown VFT & Mastic under Carpeting	Building # 2036 Apt A & B and Building # 2082 Apt B	2% Chrysotile 3% Chrysotile	Intact	955 SF	CAT I CAT II
Mastic associated w/ Multi-Layered Flooring under Faux Wood Laminate Flooring	Building # 2036 Apt A & Building # 2082 Apt B	2% Chrysotile 3% Chrysotile	Intact	655 SF	CAT I CAT II
Mastic associated w/ Stair Tread	Building # 2082 Apt B	2% Chrysotile	Intact	12 SF	CAT II
Residual Flooring Mastic	Building # 2082 Apt C	2% Chrysotile	Intact	460 SF	CAT II
Mastic associated w/ Multi-Layered Flooring under 4 Squares Beige/Gray Peel & Stick Flooring	Building # 2082 Apt B	5% Chrysotile	Intact	300 SF	CAT II

* Laboratory analytical data sheets should be reviewed for potential asbestos content within individual layers of a sample for each material. Analysis of an individual layer of a material may exceed 1% while the composite analysis of the material as a whole is below 1%. Laboratory analytical data sheets are presented within Appendix A.

Asbestos containing material (ACM) as defined by the EPA and OSHA are materials with an asbestos concentration of greater than 1% (>1%) as analyzed by polarized light microscopy (PLM). In addition, ACM is designated as follows for NESHAP compliance:

Friable asbestos – material which can be crumbled, pulverized or reduced to powder by hand pressure, a.k.a. Regulated Asbestos Containing Materials (RACM)

Category I non-friable – includes resilient floor coverings, asphalt roofing products, gaskets and packings.

Category II non-friable – any non-friable ACM that is not in Category I (i.e. transite siding material).

INTRODUCTION

A NESHAP based asbestos survey was completed for EMG, Inc. (Client) on Decemeber 13, 2018 at the Nelson Park Apartments Building # 2036 located at 1994 Maryland Avenue in Columbus, Ohio by RiskNomics. The inspection included interior and exterior building materials expected to be impacted during upcoming renovation activities.

Inspection activities were performed by Charles R. McKee, a USEPA AHERA trained Asbestos Building Inspector, and State of Ohio licensed Asbestos Hazard Evaluation Specialist. Copies of current Certifications can be found in Appendix B.

SUSPECT ASBESTOS CONTAINING MATERIALS

The following suspect asbestos containing materials were identified and found Negative for Asbestos:

Nelson Park Apts - Building # 2036	
NEGATIVE MATERIALS	
Drywall	Ceiling Texture
Brown Cove Base & Adhesive	White Cove Base & Adhesive
White Ceramic Tile & Mastic & Grout	Cinder Block & Mortar
Brown Marbled Peel & Stick Tiles & Adhesive	Carpet Adhesive
HVAC Vibration Gasket	Brick & Mortar
Exterior Window/Door Caulking	Blue 12" VFT w/ Streaks & Mastic
Tan 12" VFT w/ Streaks & Mastic	Gray Exterior Caulking
Roofing Shingles & Tar Paper	Blown-In Insulation
Brick Seam Caulking & Mortar	
Nelson Park Apts - Building # 2082 (partial)	
Gray Sink Mastic	Dark Blue 12" VFT w/ Streaks & Mastic

SUSPECT ASBESTOS CONTAINING MATERIALS – ASSUMED ASBESTOS

The following suspect asbestos containing materials were identified but not sampled to maintain the materials' integrity and aesthetics, or were inaccessible due to tenant occupancy at the time of the inspection (assumed asbestos containing materials):

Building 2036
All Identified Suspect Materials were Sampled

ASBESTOS SAMPLING AND ANALYTICAL PROCEDURES

Sampling Procedures

Representative bulk samples of suspect asbestos containing building materials were randomly collected within building. Homogenous material determination was based on the following criteria:

Similar physical characteristics (same color and texture, etc.)
Application (sprayed-on, troweled-on, assembly into a system etc.)
Material function (Thermal insulation, floor tile, wallboard system etc.)

The bulk samples were collected on the inspection date(s). Condition assessments were performed by the accredited inspectors during the inspection.

PLM Analysis Methodology

Laboratory services were provided by Apex Precision Analytical Services (APASI Labs) located in Friendswood, TX, a National Voluntary Laboratory Accreditation Program (NVLAP) certified laboratory (NVLAP code #200633-0).

PLM samples were analyzed utilizing the Environmental Protection Agency's Test Methods: Methods for the determination of Asbestos in Bulk Building Materials (EPA 600/R-93/116, July 1993) and the McCrone Research Institute's The Asbestos Particle Atlas as method references. Additional treatment and tests may be required to accurately define composition (i.e. ashing, extraction, acetone treatment, and TEM).

Analysis was performed by using the bulk sample for visual observation and slide preparation(s) for microscopic examination and identification. The samples analyzed for asbestos (chrysotile, amosite, crocidolite, anthophyllite, and actinolite/ tremolite), fibrous non-asbestos constituents (mineral wool, cellulose, etc.) and non-fibrous constituents. Using a stereoscope, the microscopist visually estimated relative amounts of each constituent by determining the volume of each constituent in proportion to the total volume of the sample.

FINDINGS

Interpretation of Asbestos Results

Federal OSHA and EPA define an ACM as any material containing >1% asbestos. The lower limit of reliable detection for asbestos using the PLM analytical method is 1.0% by volume. If "<1%" appears in this report, it should be interpreted as meaning that asbestos was present in the sample, but the exact percentage is unknown.

Furthermore, per EPA NESHAP regulations, friable material with PLM-derived asbestos concentration of <10% must be assumed to be ACM until it is point counted to more precisely determine the actual asbestos content. If this material is found to contain less than 1% asbestos by point counting, then it may be disposed of as non-hazardous waste. Any sample can be subjected to the more stringent Point Count Method of analysis to more precisely determine the actual asbestos content.

Although a material may contain asbestos at <1%, it **DOES NOT** relieve contractors from performing exposure assessments (personal air monitoring) on their employees per the OSHA Asbestos Standard (29 CFR 1926.1101) and should not be interpreted as asbestos is not present.

Although a reading may indicate “<1%”, airborne asbestos concentrations still may exceed the OSHA Permissible Exposure Limit (PEL) depending on the work activity.

The following materials contain Asbestos in concentrations exceeding 1%

- Drywall Joint Compound
- Drywall Wall Texture
- Black Sink Mastic
- Brown VFT & Mastic under Carpeting
- Mastic associated w/ Multi-layered Flooring under Faux Wood Laminate
- Mastic associated w/ Stair Tread
- Black Residual Flooring Mastic
- Mastic associated w/ Multi-layered Flooring under Beige/Gray Squares P&S Tile

CONCLUSIONS AND RECOMMENDATIONS

Results of analysis confirmed asbestos was identified in concentrations greater than 1% within some of the bulk samples collected. The identified asbestos-containing materials were found to be in good condition at the time of this inspection. Materials uncovered during renovation or demolition activities that are not addressed in this inspection report must be sampled by an accredited asbestos inspector prior to any disturbance.

Regulations require notifications prior to the removal of asbestos-containing materials. If the quantity of the asbestos to be removed is greater than or equal to 160 square/260 linear feet, the contractor shall submit an asbestos notification at least ten working days before asbestos removal begins. An EPA AHERA trained supervisor (state certified where applicable) shall be onsite during all asbestos removal activities and all persons handling asbestos shall be workers or supervisors certified by the EPA (state certified where applicable). Removal shall be performed following all applicable local and federal regulations.

The U.S. Environmental Protection Agency (USEPA) regulations do not require removal of asbestos-containing materials that are in good condition. However, personnel who may be involved with building renovations will need to be advised of the presence of asbestos and appropriate measures may be warranted in order to assure the identified asbestos-containing materials are not disturbed during renovation activities. If the asbestos-containing materials left in place are disturbed during renovation activities, the materials must be handled and disposed of in accordance with applicable State and Federal regulations.

DISCLAIMER

The content presented in this report is based on data collected during the site inspection and survey, review of pertinent regulations, requirements, guidelines and commonly followed industry standards, and information provided by the Client, their clients, agents, and representatives.

In occupied facilities and areas, destructive investigation may not have been performed in order to protect the materials aesthetics while the facility was in operation. This may include, but not be limited to: penetration into walls and hard lid ceilings; and investigation that may irreparably damage mirrors and similar components.

The work has been conducted in an objective and unbiased manner and in accordance with generally accepted professional practice for this type of work. RiskNomics believes the data and analysis to be accurate and relevant, but cannot accept responsibility for the accuracy or completeness of available documentation or possible withholding of information of other parties.

This hazardous materials survey report is designed to aid the property owner, architect, construction manager, general contractor, and asbestos abatement contractor in locating ACM. This report is not intended for, and may not be utilized, as a bidding document or as an abatement project specification document.

APPENDIX A

LABORATORY ANALYTICAL DATA

ASBESTOS BULK ANALYSIS REPORT

Date: December 21, 2018

RiskNomics

Report: 6818-7511
18RN2688 / Nelson Parks Apartments -
Building # 2036 and 2082

This document shall be considered a duly signed original report of the results obtained from the analysis(es) performed. All analyses are done within government guidelines and regulations.

A handwritten signature in black ink, appearing to read 'G.R. Simmons', is positioned above a solid black horizontal line.

Gary R. Simmons
Laboratory Manager

Lab Comments on Project: N/A

PLM (Bulk) - Asbestos Analysis Report - Visual ID (EPA Method 600/R-93-116 Visual Area Estimation)

Analytical results and reports are generated by Apex Precision Analytical Services at the request of and for the exclusive use of the person or entity (client) named on such report. Result, reports or copies of same will not be released by Apex Precision Analytical Services to any third party without the written request from client. These results only represent the materials submitted. Supporting laboratory documentation is available upon request. This report cannot be used to represent conditions at any other location, date or time and does not imply that this space is free from these or any other contaminants. No responsibility or liability is assumed for the manner in which these results are used or interpreted. This must not be used to claim product endorsement by NVLAP or any government agency of the United States. Apex Precision Analytical Services reserves the right to dispose of all samples after a period of thirty (30) days, according to all state and federal guidelines, unless otherwise specified.

Analytical results and reports are generated by Apex Precision Analytical Services at the request of and for the exclusive use of the person or entity (client) named on such report. Result, reports or copies of same will not be released by Apex Precision Analytical Services to any third party without the written request from client. These results only represent the materials submitted. Supporting laboratory documentation is available upon request. This report cannot be used to represent conditions at any other location, date or time and does not imply that this space is free from these or any other contaminants. No responsibility or liability is assumed for the manner in which these results are used or interpreted. This must not be used to claim product endorsement by NVLAP or any government agency of the United States. Apex Precision Analytical Services reserves the right to dispose of all samples after a period of thirty (30) days, according to all state and federal guidelines, unless otherwise specified.

APPENDIX L: RESUMES

Joslyn Smith

Senior Environmental Consultant

Education

BS, Biology, Henderson State University

Project Experience

Biomedical facilities, Winston-Salem, North Carolina, Environmental

- Ms. Smith performed Phase I Environmental Assessments for Brownfield revitalization properties in Winston-Salem, North Carolina. Properties included former tobacco manufacturing facilities with environmental impact issues and considerable historical considerations. She completed onsite visits and reports with recommendations within an expedited time frame. The reports were detrimental to investment decisions.

Blackstone Industrial Portfolio, Toronto, Canada, Environmental

- Ms. Smith completed 11 on-site visits in four days to support a quick turn-around time for a portfolio of industrial facilities in Toronto, Ontario, Canada. Sites included heavy manufacturing facilities with complex operations and environmental considerations. Her work helped BV complete this project on schedule and within the budget.

Lynx portfolio, San Francisco, CA, Environmental

- Ms. Smith performed assessments for three hotels in the historic district of San Francisco. The on-site visits were completed during the weekend in order to ensure the project was completed within a rushed time frame. Ms. Smith's responsibilities included unique considerations related to the historic nature of the buildings and surrounding areas. Ms. Smith completed quality reports and recommendations in an expedited time frame.

Trios Portfolio, Kennewick, Washington, Environmental

- Ms. Smith performed an assessment for a 2,800 acre parcel of undeveloped, naturally vegetated scrub and canyon land. The on-site visits included extensive survey hours over areas without normal access ways. Ms. Smith's report and recommendations were integral in client acquisition considerations.

Special Skills/Training

- AAI/ASTM E1527-13 Environmental Professional (EP)

Regional Location

Little Rock, Arkansas

Project Experience Cont.

Gas station properties, Various cities, Florida, Environmental

- Ms. Smith performed assessments for gas station properties throughout Florida. The properties included many regulatory issues, including underground storage tank release considerations and assessment of potential contamination concerns. The reports and recommendations were detrimental to financing requirements for the client.

CAHEC Portfolio, Georgia, Environmental

- Ms. Smith conducted report reviews for a portfolio of apartment complexes throughout Georgia. Reports were reviewed for technical accuracy prior to being finalized and submitted to the client. Ms. Smith's work helped BV issue a quality product within the schedule.

Contra Costa County HUD Portfolio, Contra Costa, California, Environmental

- Ms. Smith managed a portfolio of HUD Scope Phase I ESAs to include kick-off and coordination with the client, review, and timely delivery to the client for submittal to HUD.

Healthcare properties portfolio, Iowa and Illinois, Environmental

- Ms. Smith managed a 40 site Phase I ESA portfolio for a major US hospital group needed for a mergers and acquisitions assessment. Properties included large hospital campuses and clinics, as well as residential properties and an industrial laundry. Ms. Smith engaged in extensive communication with the client, to include the delivery of preliminary report findings prior to report finalization. The final report deliverables were issued to the client ahead of a rush deadline.

Sarah Boyd

Project Manager

Education

BS, Environmental Science, The University of Virginia
MS, Environmental Law and Policy, Vermont Law School

Project Experience

Automotive Dealership, Mountain View, California, Environmental

- Ms. Boyd performed a Phase I assessment of a large automotive dealership with 40 service bays. Scope included a review of hazardous waste manifests, hazardous material inspection and community right-to-know forms, permit records, and assessment of regulatory compliance. Recognized environmental conditions included the property's former use as a filling station and several offsite releases.

Apartment Building, Brooklyn, New York, Environmental

- Ms. Boyd performed a Phase I assessment of a 1930s residential brownstone, which included assessment for hazards caused by asbestos, lead-based paint, and radon. Oversaw radon testing event. The Phase I identified an adjacent historical dry cleaning facility and resulted in a Phase II vapor intrusion assessment. The Phase II identified vapor hazards exceeding regulatory thresholds and mitigation was recommended.

Industrial Property, Valencia, California, Environmental

- Ms. Boyd performed a Phase I assessment of a former electroplating and aircraft parts manufacturing facility, which had undergone cleanup from previous petroleum releases from on-site USTs. Groundwater sampling revealed residual chlorinated solvent contamination, of which a portion was suspected to have originated from an offsite facility. Included a review of UST removal documents, sampling data, and records of wastewater treatment system maintenance and sampling.

Hotel Property, Chelsea, Massachusetts, Environmental

- Ms. Boyd performed a Phase I assessment of a hotel facility, which was encumbered with a deed restriction as a result of contaminated fill material brought to the Project from offsite sources. Scope included a review of numerous prior environmental investigations and regulatory agency files.

Project Experience Cont.

Former Ice Arena, Culver City, California, Environmental

- Ms. Boyd performed a Phase I assessment and regulatory records review of a former ice skating rink dating from the 1960s. Reviewed the decommissioning process of the refrigeration system, which included removal of toxic anhydrous ammonia refrigerant, removal of calcium chloride brine solution, and soil sampling at the ice rink and at clarifiers connected to the municipal sewer. Study included research of local press releases, reports from industry experts, and fire department records.

Heather Hardman

Project Manager

Education

BS, Environmental Science, Ohio Dominican University

Project Experience

Industrial Warehouse, Plainfield, IN, Environmental

- As a Project Manager, Ms. Hardman performed an Environmental Phase I site assessment of this 9.19 acres industrial warehouse. She reviewed the environmentally relevant history of the property and surrounding structures and performed a thorough inspection of the Property. Her work helped EMG and the client with environmental due diligence.

Gasoline Station and Shopping Center, Oakwood, OH, Environmental

- As a Project Manager, Ms. Hardman performed an Environmental Phase I site assessment of this retail shopping center with an active gasoline station and tire installation center. She assessed the buildings and the operational activity of the tenants and gasoline station USTs to provide a thorough report. Her work helped EMG and the client with environmental due diligence.

Fannie Mae Environmental Consultation, Multiple Cities, US, Environmental

- Ms. Hardman works directly with Fannie Mae as an environmental consultant for various Fannie Mae assets impacted by environmental issues including discoloration, oil release, asbestos, methamphetamine, various bio-hazard impacts, lead and various other chemical impacts. This consultation includes working with multiple asset brokers and sales representatives, finding competitive and complete remediation estimates from issue specific qualified contractors, and review of estimates and clearance test data to ensure adequate remediation of assets. Her communication skills, knowledge of federal and state specific regulations, responsiveness and professionalism have been vital to successful remediation of Fannie Mae assets and building necessary relationships with industry contractors.

Project Experience Cont.

State Historic Preservation Reviews/HUD, Multiple Cities, US, Environmental

- Ms. Hardman works closely with various state historic preservation offices to create state specific consultation for multiple HUD related properties that require historic preservation reviews. This includes a review of Phase 1 Environmental Assessments, research of NEPA requirements for national and state specific documentation of listed and eligible historic properties, review of historic documentation for onsite and surrounding property structures, and direct consultation with state historic preservation offices and HUD to determine project eligibility. Ms. Hardman has successfully completed over 300 SHPO reviews.

HUD Skilled Nursing/Assisted Living, Multiple Cities, OH, Environmental

- Ms. Hardman has performed multiple Environmental Site Assessments of HUD skilled nursing and assisted living properties. This included observation of facilities and operations, review of previous reports and regulatory database documentation, interviews with property staff, research of municipal records and writing of HUD specific narrative reports. Her attention to detail, knowledge of environmental based regulations and activities, and thorough record keeping abilities were crucial in creating a thorough and client specific report.

RE: Short-Term Confirmatory Radon Testing at:
Nelson Park Apartments
1994 Maryland Avenue
Columbus, Ohio 43219
Bureau Veritas Project No.: 156846.22R000-001.252

Dear Sir or Madam:

Bureau Veritas has completed Confirmatory Radon Testing for the above referenced property (the "Project"). Bureau Veritas previously detected elevated radon gas levels at the Project (BV Project No. 156846.22R000-001.173) dated June 2, 2022.

The sampling was performed according to the following protocol:

- Deployment of 93 short-term radon devices at the Project in an effort to measure radon gas concentrations. The devices were placed in accordance with applicable state and federal guidelines for short-term radon testing.

The United States Environmental Protection Agency (USEPA) uses a continuous exposure level of 4.0 pCi/L as an action level at which additional action is recommended. The screening technique utilized is designed to provide initial results that will identify whether further testing or investigation is required.

On September 23, 2022 and September 27, 2022, Bureau Veritas Project Manager Mr. Kurt Brickner (NRPP cert# 107585-RMP) placed the devices and retrieved the devices on September 27, 2022 and September 29, 2022.

The samples collected and the consolidated results of the two sampling events are listed in the Radon Sampling Table below.

Radon Sampling Table			
Sample Location	Result from May 24, 2022 – May 26, 2022 Testing (pCi/L)	Result from September 23 and 27, 2022 – September 27 and 29, 2022 Testing (pCi/L)	Average Results (pCi/L)

The average laboratory analysis results for radon gas concentration indicate that the samples collected from 1934 – Unit B, 1938 – Unit D, 1942 – Unit C, Main 1958 – Unit A, 1960 – Unit D, Main – 1966, 1978 – Unit D, 1982 – Units A and D, 1984 – Units A, B and C, 1984 – Units A, B, and C, 1986 – Units B and C, 2004 – Units A and C, 2006 – Units B and D, 2010 – Unit B, 2014 – D, Main – 2020, Main – 2022, 2036 – Units A and C, 2038 – Unit A, 2060 – Units B and C, 2040 – Unit D, Main – 2056, Main – 2064, 2066 – Unit D, 2078 – Units C and D, 2082 – Units A, B and D, 2084 – Units B, C and D, 2086 – Units A and D, Main – 2092, Main – 2094, Main – 2096, Main – 2054, 2100 – Units A and C, 2104 – Unit D, Main 2108, Main – 445, Main – 447, Main – 449, Main – 451 and Main – 461 are above the action level of 4.0 pCi/L as established by the USEPA. No keys were available to access 1978 – Unit A, 1962 – Unit D and 1984 – Unit D.

Bureau Veritas recommends the installation of radon gas mitigation systems in 1934 – Unit B, 1938 – Unit D, 1942 – Unit C, Main 1958 – Unit A, 1960 – Unit D, Main – 1966, 1978 – Unit D, 1982 – Units A and D, 1984 – Units A, B and C, 1984 – Units A, B, and C, 1986 – Units B and C, 2004 – Units A and C, 2006 – Units B and D, 2010 – Unit B, 2014 – D, Main – 2020, Main – 2022, 2036 – Units A and C, 2038 – Unit A, 2060 – Units B and C, 2040 – Unit D, Main – 2056, Main – 2064, 2066 – Unit D, 2078 – Units C and D, 2082 – Units A, B and D, 2084 – Units B, C and D, 2086 – Units A and D, Main – 2092, Main – 2094, Main – 2096, 2100 – Units A and C, 2104 – Unit D, Main 2108, Main – 445, Main – 447, Main – 449, Main – 451 and Main – 461; 1978 – Unit A, 1962 – Unit D and 1984 – Unit D – no keys to access. On average, one system mitigates one apartment unit or between 1,300 to 1,700 square feet of open building area. Radon mitigation systems require routine maintenance and upkeep, and typically the fans need replacing after approximately seven (7) years; therefore, the mitigation systems should be inspected on an annual basis (i.e., fans working properly). The cost to install a radon mitigation system may vary depending upon the size of the building/unit, interior design of the building/unit, the type of roofing system, type of soils and/or fill material beneath the building slab or building foundation, and depth to perched water and/or groundwater table.

There can be uncertainty with any radon measurement due to statistical variations, such as daily and seasonal fluctuations in radon concentrations, weather changes, operation of the HVAC system, and interference with closed house conditions.

The Project should be retested if any of the following occur:

- The property has a mitigation system installed (retest every two years);
- An addition is added to the property;
- An alteration is made that could change the ventilation pattern;
- Major cracks or penetrations occur in the foundation walls or slab;
- Significant nearby construction blasting or an earthquake occurs;
- Changes are made or happen to an installed mitigation system; or
- Occupation of a ground contact area that was not previously tested.

If you have any questions regarding this report, please contact me below at (800) 733-0660, Ext. 6455.

Sincerely,

Monica Graves-Thompson

TESTING OVERVIEW

On September 23 & 27, 2022, I placed 93 short term passive **charcoal** devices analyzed by Airchek, Inc, ODH Approval # RL10 via the EPA Method 402-R-92-004. The devices were retrieved on September 27 & 29, 2022.

Measurement Criteria: During a short-term test (2-90 days), to the extent reasonable, all windows, outside vents, and external doors should be kept closed (except for normal entering and exiting) during the testing period. In addition, for tests less than 4 days, closed-building conditions are required for 12 hours prior to the start of the test. Other than a furnace, fans ventilation systems, and air-cooling, systems that use outside air and exhaust inside air should not be operated. Operation of dryers, range hoods, and bathroom fans should be kept to a minimum.

Testing Protocols: The testing scope for this was to test the elevated units and units we were unable to get results for, 10% duplicates and 5% blanks. Residents were informed on the requirement to maintain closed housing conditions for the testing period.

The table below shows the locations and results for the testing.

Device #	Building#	Floor	Unit#	Location in Room	Start Date	Start Time	Stop Date	Stop Time	Results - pCi/L

Conclusion:

We were unable to access the following unit:

1. 1978-A - No Key

We were unable to retrieve the testers placed in the following units:

1. 1962-D - No Key For Reentry
2. 1984 - D - No Key For Reentry

We had the following 54 units come back with an average radon level above the 4.0 pCi/L threshold between the initial and retest:

1. 1934 - B - 4.6 pCi/L
2. 1938 - D - 11.8 pCi/L
3. 1942 - C - 5 pCi/L
4. Main - A - 4.3 pCi/L
5. 1960 - D - 4.5 pCi/L
6. Main - 1966 - 11.9 pCi/L
7. 1978 - D - 6.4 pCi/L
8. 1982 - A - 6.6 pCi/L
9. 1982 - D - 13.7 pCi/L
10. 1984 - A - 15.6 pCi/L
11. 1984 - B - 4.9 pCi/L
12. 1984 - C - 8 pCi/L
13. 1986 - C - 4.4 pCi/L
14. 1986 - B - 9 pCi/L
15. 2004 - A - 12.4 pCi/L
16. 2004 - C - 9.4 pCi/L
17. 2006 - B - 12.8 pCi/L
18. 2006 - D - 11.1 pCi/L
19. 2010 - B - 10.3 pCi/L
20. 2014 - D - 7.8 pCi/L
21. Main - 2020 - 8.5 pCi/L
22. Main - 2022 - 8.8 pCi/L
23. 2036 - A - 5.5 pCi/L
24. 2036 - C - 4.7 pCi/L
25. 2038 - A - 7.8 pCi/L
26. 2060 - B - 5.3 pCi/L
27. 2040 - D - 8.1 pCi/L
28. Main - 2056 - 13.2 pCi/L
29. 2060 - C - 11.1 pCi/L
30. Main - 2064 - 8.2 pCi/L
31. 2066 - D - 12.7 pCi/L
32. 2078 - C - 15.7 pCi/L

- 33. 2078 - D - 7.7 pCi/L
- 34. 2082 - A - 12.8 pCi/L
- 35. 2082 - B - 19.2 pCi/L
- 36. 2082 - D - 27.7 pCi/L
- 37. 2084 - A - 17.1 pCi/L
- 38. 2084 - B - 18.9 pCi/L
- 39. 2084 - C - 20.4 pCi/L
- 40. 2084 - D - 36.3 pCi/L
- 41. 2086 - A - 14.4 pCi/L
- 42. 2086 - B - 13.2 pCi/L
- 43. Main - 2092 - 9.7 pCi/L
- 44. Main - 2094 - 5 pCi/L
- 45. Main - 2096 - 8.4 pCi/L
- 46. 2100 - A - 11.6 pCi/L
- 47. 2100 - C - 11.4 pCi/L
- 48. 2104 - D - 5.1 pCi/L
- 49. Main - 2108 - 10.2 pCi/L
- 50. Main - 445 - 10.8 pCi/L
- 51. Main - 447 - 14.6 pCi/L
- 52. Main - 449 - 5.4 pCi/L
- 53. Main - 451 - 11.3 pCi/L
- 54. Main - 461 - 9.9 pCi/L

We recommend mitigation of the elevated and missing units.

All quality control measurements came in with acceptable results.

Sincerely,

Brickner, Kurt A.

SUMMARY OF RADON INSPECTION

Date: June 2, 2022

Client: Bureau Veritas
 10461 Mill Run Circle
 Suite 1100
 Owings Mills, MD 21117
Attn: Mrs. Monica Graves-Thompson

Site: Nelson Park Apts
 1994 Maryland Avenue
 Columbus, OH 43219

Project#: 156846.22R-001.173

TESTING OVERVIEW

On May 24, 2022, I placed 157 short term passive **charcoal** devices analyzed by Airchek, Inc, ODH Approval # RL10 via the EPA Method 402-R-92-004. The devices were retrieved on May 26, 2022.

Measurement Criteria: During a short-term test (2-90 days), to the extent reasonable, all windows, outside vents, and external doors should be kept closed (except for normal entering and exiting) during the testing period. In addition, for tests less than 4 days, closed-building conditions are required for 12 hours prior to the start of the test. Other than a furnace, fans ventilation systems, and air-cooling, systems that use outside air and exhaust inside air should not be operated. Operation of dryers, range hoods, and bathroom fans should be kept to a minimum.

Testing Protocols: The testing scope for this was to test 100% of the ground floor units, 10% of each additional floor, 10% duplicates and 5% blanks. Residents were informed on the requirement to maintain closed housing conditions for the testing period.

The table below shows the locations and results for the testing.

Device #	Building#	Floor	Unit#	Location in Room	Start Date	Start Time	Stop Date	Stop Time	Results - pCi/L

Conclusion:

We were unable to access the following units:

1. 1928
2. 1942-B
3. 1962-C
4. 1962-D
5. 1966
6. 1978-A
7. 1984-A
8. 1984-D
9. 2004-A
10. 2006-B
11. 2010-B
12. 2032-A
13. 2032-B
14. 2036-A
15. 2036-C
16. 2060-B

17. 2060-C
18. 2064
19. 2068
20. 2070
21. 2084-B
22. 2084-C
23. 2106
24. 449
25. 451

We were unable to retrieve the testers placed in the following units:

1. 1942 - C - No Key For Reentry
2. 1960 - D - Missing
3. 1970 - Missing
4. 1982 - D - Missing
5. 1986 - C - No Key For Reentry
6. 1986 - B - No Key For Reentry
7. 1996 - Community Room - Missing
8. 2004 - C - Missing
9. 2006 - D - Damaged
10. 2014 - C - Missing
11. 2010 - B - No Key For Reentry
12. 2060 - D - No Key For Reentry
13. 2062 - B - Missing
14. 2066 - D - Missing
15. 2082 - D - No Key For Reentry
16. 2084 - D - No Key For Reentry
17. 2086 - A - Missing
18. 2086 - B - No Key For Reentry
19. 2094 - No Key For Reentry
20. 2096 - No Key For Reentry
21. 457 - No Key For Reentry

We had the following 33 units come back with an average radon level above the 4.0 pCi/L threshold:

1. 1934 - B - 4.7 pCi/L (4.4, 4.9)
2. 1938 - D - 11.5 pCi/L (11.3, 11.6)
3. 1958 - A - 4.2 pCi/L
4. 1978 - D - 5.2 pCi/L
5. 1982 - D - 5.2 pCi/L
6. 1982 - A - 4.7 pCi/L
7. 1984 - B - 5.5 pCi/L
8. 1984 - C - 5.6 pCi/L
9. 2014 - D - 11.2 pCi/L
10. Main - 2020 - 4.8 pCi/L
11. Main - 2022 - 5.9 pCi/L
12. 2032- C - 4.1 pCi/L
13. 2038 - A - 4.2 pCi/L
14. 2040 - D - 6.4 pCi/L
15. Main - 2056 - 10.2 pCi/L

16. 2054 - 9.2 pCi/L
17. 2078 - C - 11.6 pCi/L
18. 2078 - D - 4.7 pCi/L
19. 2082 - A - 6.3 pCi/L
20. 2082 - B - 24.3 pCi/L
21. 2084 - A - 18.3 pCi/L
22. Main - 2090 - 4 pCi/L
23. Main - 2092 - 8.5 pCi/L
24. 2100 - A - 7.8 pCi/L
25. 2100 - B - 4 pCi/L
26. 2100 - C - 8.7 pCi/L
27. 2104 - D - 4.3 pCi/L
28. Main - 2108 - 11.2 pCi/L
29. Main - 2112 - 5.4 pCi/L
30. Main - 445 - 12.4 pCi/L
31. Main - 447 - 16.9 pCi/L
32. 2104 - A - 4.5 pCi/L
33. Main - 461 - 12.7 pCi/L

We recommend retesting or mitigation of the elevated and missing units.

All quality control measurements came in with acceptable results.

Sincerely,

Brickner, Kurt A.

RE: Short-Term Radon Testing at:
Nelson Park Apartments
1994 Maryland Avenue
Columbus, Ohio 43219
Bureau Veritas Project No.: 156846.22R000-001.173

Dear Sir or Madam:

Bureau Veritas has completed Short-Term Radon Testing for Nelson Park Apartments in Columbus, Ohio (the "Project").

The sampling was performed according to the following protocol:

- Deployment of 157 short-term radon devices in an effort to measure radon gas concentrations. The testing was performed in accordance with ANSI/AARST *Protocol for Conducting Radon and Radon Decay Product Measurements in Large Buildings* (ANSI/AARST MAMF-2017 (rev. 1/21). QA/QC samples (field blanks and duplicates) were also submitted in accordance with AARST guidelines.

The United States Environmental Protection Agency (USEPA) uses a continuous exposure level of 4.0 pCi/L as an action level at which additional action is recommended. The screening technique utilized is designed to provide initial results that will identify whether further testing or investigation is required.

On May 24, 2022, Bureau Veritas Project Manager Mr. Kurt Brickner (NRPP cert# 107585-RMP) placed the devices and retrieved the devices on May 26, 2022.

The samples collected and the results of the sampling event are listed in the Radon Sampling Table below.

Radon Sampling Table	
Sample Location	Results (pCi/L)
Building 1934 – Unit B	4.7 (4.9, 4.4)

The laboratory analysis results for radon gas concentration indicate that the samples collected from Building 1934 – Unit B, Building 1938 – Unit D, Building 1958 – Unit A, Building 1978 – Unit D, Building 1982 – Unit D, Building 1982 – Unit A, Building 1984 – Unit B, Building 1984 – Unit C, Building 2014 – Unit D, Main Building – 2020, Main Building – 2022, Building 2032 – Unit C, Building 2038 – Unit A, Building 2040 – Unit D, Main Building – 2056, Main Building – 2054, Building – 2078 – Unit C, Building 2078 – Unit D, Building 2082 – Unit A, Building 2082 – Unit B, Building 2084 – Unit A, Main Building – 2090, Main Building – 2092, Building 2100 – Unit A, Building 2100 – Unit B, Building 2100 – Unit C, Building 2104 – Unit D, Main Building – 2108, Main Building – 2112, Main Building – 445, Main Building – 447, Building 2104 – Unit A and Main Building – 461 are above the action level of 4.0 pCi/L as established by the USEPA.

There was no access to Main Building – 1928, Building 1942 – Unit B, Building 1962 – Unit C, Building 1962 – Unit D, Main Building 1966, Building 1978 – Unit A, Building 1984 – Unit A, Building 1984 – Unit D, Building 2004 – Unit A, Building 2006 – Unit B, Building 2010 – Unit B, Building 2032 – Unit A, Building 2032 – Unit B, Building 2036 – Unit A, Building 2036 – Unit C, Building 2060 – Unit B, Building 2060 – Unit C, Main Building 2064, Main Building 2068, Main Building 2070, Building 2084 – Unit B, Building 2084 – Unit C, Main Building 2106, Main Building 449 and Main Building 451.

There were missing devices and access issues for Building 1942 – Unit C - No Key For Reentry, Building 1960 – Unit D – Missing, Main Building 1970 – Missing, Building 1982 – Unit D – Missing, Building 1986 – Unit C - No Key For Reentry, Building 1986 – Unit B - No Key For Reentry, Building 1996 - Community Room – Missing, Building 2004 – Unit C – Missing, Building 2006 – Unit D – Damaged, Building 2014 – Unit C – Missing, Building 2010 – Unit B - No Key For Reentry, Building 2060 – Unit D - No Key For Reentry, Building 2062 – Unit B – Missing, Building 2066 – Unit D – Missing, Building 2082 – Unit D - No Key For Reentry, Building 2084 – Unit D - No Key For Reentry, Building 2086 – Unit A – Missing, Building 2086 – Unit B - No Key For Reentry, Main Building 2094 - No Key For Reentry, Main Building 2096 - No Key For Reentry and Main Building 457 – No Key For Reentry.

Bureau Veritas (BV) recommends retesting Building 1934 – Unit B, Building 1938 – Unit D, Building 1958 – Unit A, Building 1978 – Unit D, Building 1982 – Unit D, Building 1982 – Unit A, Building 1984 – Unit B, Building 1984 – Unit C, Building 2014 – Unit D, Main Building – 2020, Main Building – 2022, Building 2032 – Unit C, Building 2038 – Unit A, Building 2040 – Unit D, Main Building – 2056, Main Building – 2054, Building – 2078 – Unit C, Building 2078 – Unit D, Building 2082 – Unit A, Building 2082 – Unit B, Building 2084 – Unit A, Main Building – 2090, Main Building – 2092, Building 2100 – Unit A, Building 2100 – Unit B, Building 2100 – Unit C, Building 2104 – Unit D, Main Building – 2108, Main Building – 2112, Main Building – 445, Main Building – 447, Building 2104 – Unit A and Main Building – 461 to confirm results in these areas.

BV also recommends testing Main Building – 1928, Building 1942 – Unit B, Building 1962 – Unit C, Building 1962 – Unit D, Main Building 1966, Building 1978 – Unit A, Building 1984 – Unit A, Building 1984 – Unit D, Building 2004 – Unit A, Building 2006 – Unit B, Building 2010 – Unit B, Building 2032 – Unit A, Building 2032 – Unit B, Building 2036 – Unit A, Building 2036 – Unit C, Building 2060 – Unit B, Building 2060 – Unit C, Main Building 2064, Main Building 2068, Main Building 2070, Building 2084 – Unit B, Building 2084 – Unit C, Main Building 2106, Main Building 449, Main Building 451, Building 1942 – Unit C - No Key For Reentry, Building 1960 – Unit D – Missing, Main Building 1970 – Missing, Building 1982 – Unit D – Missing, Building 1986 – Unit C - No Key For Reentry, Building 1986 – Unit B - No Key For Reentry, Building 1996 - Community Room – Missing, Building 2004 – Unit C – Missing, Building 2006 – Unit D – Damaged, Building 2014 – Unit C – Missing, Building 2010 – Unit B - No Key For Reentry, Building 2060 – Unit D - No Key For Reentry, Building 2062 – Unit B – Missing, Building 2066 – Unit D – Missing, Building 2082 – Unit D - No Key For Reentry, Building 2084 – Unit D - No Key For Reentry, Building 2086 – Unit A – Missing, Building 2086 – Unit B - No Key For Reentry, Main Building 2094 - No Key For Reentry, Main Building 2096 - No Key For Reentry and Main Building 457 – No Key For Reentry to obtain results from these areas.

There can be uncertainty with any radon measurement due to statistical variations, such as daily and seasonal fluctuations in radon concentrations, weather changes, operation of the HVAC system, and interference with closed house conditions.

If you have any questions regarding this report, please contact me below at (800) 733-0660, Ext. 6455.

Sincerely,

Monica Graves-Thompson

SUMMARY OF RADON INSPECTION

Date: June 2, 2022

Client: Bureau Veritas
 10461 Mill Run Circle
 Suite 1100
 Owings Mills, MD 21117
Attn: Mrs. Monica Graves-Thompson

Site: Nelson Park Apts
 1994 Maryland Avenue
 Columbus, OH 43219

Project#: 156846.22R-001.173

TESTING OVERVIEW

On May 24, 2022, I placed 157 short term passive **charcoal** devices analyzed by Airchek, Inc, ODH Approval # RL10 via the EPA Method 402-R-92-004. The devices were retrieved on May 26, 2022.

Measurement Criteria: During a short-term test (2-90 days), to the extent reasonable, all windows, outside vents, and external doors should be kept closed (except for normal entering and exiting) during the testing period. In addition, for tests less than 4 days, closed-building conditions are required for 12 hours prior to the start of the test. Other than a furnace, fans ventilation systems, and air-cooling, systems that use outside air and exhaust inside air should not be operated. Operation of dryers, range hoods, and bathroom fans should be kept to a minimum.

Testing Protocols: The testing scope for this was to test 100% of the ground floor units, 10% of each additional floor, 10% duplicates and 5% blanks. Residents were informed on the requirement to maintain closed housing conditions for the testing period.

The table below shows the locations and results for the testing.

Device #	Building#	Floor	Unit#	Location in Room	Start Date	Start Time	Stop Date	Stop Time	Results - pCi/L

Conclusion:

We were unable to access the following units:

1. 1928
2. 1942-B
3. 1962-C
4. 1962-D
5. 1966
6. 1978-A
7. 1984-A
8. 1984-D
9. 2004-A
10. 2006-B
11. 2010-B
12. 2032-A
13. 2032-B
14. 2036-A
15. 2036-C
16. 2060-B

17. 2060-C
18. 2064
19. 2068
20. 2070
21. 2084-B
22. 2084-C
23. 2106
24. 449
25. 451

We were unable to retrieve the testers placed in the following units:

1. 1942 - C - No Key For Reentry
2. 1960 - D - Missing
3. 1970 - Missing
4. 1982 - D - Missing
5. 1986 - C - No Key For Reentry
6. 1986 - B - No Key For Reentry
7. 1996 - Community Room - Missing
8. 2004 - C - Missing
9. 2006 - D - Damaged
10. 2014 - C - Missing
11. 2010 - B - No Key For Reentry
12. 2060 - D - No Key For Reentry
13. 2062 - B - Missing
14. 2066 - D - Missing
15. 2082 - D - No Key For Reentry
16. 2084 - D - No Key For Reentry
17. 2086 - A - Missing
18. 2086 - B - No Key For Reentry
19. 2094 - No Key For Reentry
20. 2096 - No Key For Reentry
21. 457 - No Key For Reentry

We had the following 33 units come back with an average radon level above the 4.0 pCi/L threshold:

1. 1934 - B - 4.7 pCi/L (4.4, 4.9)
2. 1938 - D - 11.5 pCi/L (11.3, 11.6)
3. 1958 - A - 4.2 pCi/L
4. 1978 - D - 5.2 pCi/L
5. 1982 - D - 5.2 pCi/L
6. 1982 - A - 4.7 pCi/L
7. 1984 - B - 5.5 pCi/L
8. 1984 - C - 5.6 pCi/L
9. 2014 - D - 11.2 pCi/L
10. Main - 2020 - 4.8 pCi/L
11. Main - 2022 - 5.9 pCi/L
12. 2032- C - 4.1 pCi/L
13. 2038 - A - 4.2 pCi/L
14. 2040 - D - 6.4 pCi/L
15. Main - 2056 - 10.2 pCi/L

16. 2054 - 9.2 pCi/L
17. 2078 - C - 11.6 pCi/L
18. 2078 - D - 4.7 pCi/L
19. 2082 - A - 6.3 pCi/L
20. 2082 - B - 24.3 pCi/L
21. 2084 - A - 18.3 pCi/L
22. Main - 2090 - 4 pCi/L
23. Main - 2092 - 8.5 pCi/L
24. 2100 - A - 7.8 pCi/L
25. 2100 - B - 4 pCi/L
26. 2100 - C - 8.7 pCi/L
27. 2104 - D - 4.3 pCi/L
28. Main - 2108 - 11.2 pCi/L
29. Main - 2112 - 5.4 pCi/L
30. Main - 445 - 12.4 pCi/L
31. Main - 447 - 16.9 pCi/L
32. 2104 - A - 4.5 pCi/L
33. Main - 461 - 12.7 pCi/L

We recommend retesting or mitigation of the elevated and missing units.

All quality control measurements came in with acceptable results.

Sincerely,

Brickner, Kurt A.

1. Executive Summary

Bureau Veritas performed an Asbestos Inspection that included on site observations of the accessible areas of Nelson Park Apartments (the "Project"), on May 22–June 16, 2023. The Project is located at 1994 Maryland Avenue, Columbus, Ohio 43219.

The following summarizes the independent conclusions representing Bureau Veritas's best professional judgment based on information and data available to us during the course of this assignment. Factual information regarding operations, conditions, and test data provided by the Client, owner, or their representative has been assumed to be correct and complete. Additionally, the conclusions presented are based on the conditions that existed at the time of the assessment.

Bureau Veritas collected and analyzed one thousand five hundred six (1,506) bulk samples with laboratory analysis of bulk samples showing asbestos to be present (>1% by weight) in one hundred seventy-two (172) samples. <1% Asbestos was detected in eight (8) materials.

2. Certification

Bureau Veritas has completed an Asbestos Inspection of Nelson Park Apartments (the "Project"), located at 1994 Maryland Avenue, Columbus, Ohio 43219. The inspection was performed at the Client's request using the methods and procedures consistent with good commercial and customary practice designed to conform to acceptable industry standards.

This report has been prepared for and is exclusively for the use and benefit of the Client identified on the cover page of this report. The purpose for which this report shall be used shall be limited to the use as stated in the contract between the client and Bureau Veritas.

This report, or any of the information contained therein, is not for the use or benefit of, nor may it be relied upon by any other person or entity, for any purpose without the advance written consent of Bureau Veritas. Any reuse or distribution without such consent shall be at the client's or recipient's sole risk, without liability to Bureau Veritas.

The independent conclusions represent our professional judgment based on information and data available to us during the course of this assignment. Factual information regarding operations, conditions, and test data provided by the Client or their representative has been assumed to be correct and complete. The conclusions presented are based on the data provided, observations, and conditions that existed on the date of the onsite visit.

If you have any questions regarding this report, please contact Deirdre Fontaine at (800) 733-0660, Ext. 7296337.

Bureau Veritas

3. Survey Scope

This survey was conducted at the request of the Client for the purpose of identifying asbestos-containing materials (ACM) throughout the Project in the area to be affected by the renovation.

A Licensed Asbestos Building Inspector visually inspected the building for suspect ACMs. Methodologies used were generally consistent with USEPA publications: "Guidance for Controlling Asbestos Containing Materials in Buildings" (June 1985) and "Asbestos in Buildings: Simplified Sampling Scheme for Friable Surfacing Materials" (dated October 1985). The documents were used for their asbestos survey concepts, such as identifying homogeneous materials, quantifying materials, and evaluating friability (potential to crumble with hand pressure) and condition (good, damaged). Over 3,000 products are currently known to contain asbestos. Although no comprehensive list of asbestos containing materials exists, Bureau Veritas utilized the USEPA's "Sample List of Suspect Asbestos-Containing Materials" as a general guide to identify and document suspect asbestos containing materials within the building. In addition, in some cases, the Bureau Veritas inspector utilized their experience and the knowledge obtained through training courses to identify suspect asbestos containing materials.

During the survey, the inspector classified each suspect ACM as one of three types: 1) surfacing material applied by spray or trowel, 2) thermal system insulation on pipes, tanks, boilers and related features, or 3) miscellaneous material not classified as surfacing material or thermal system insulation. The inspector touched all assumed or suspected materials on all surfaces, including walls, ceilings, structural members, and mechanical equipment, to determine their friability, or the extent to which the material, when dry, may be crumbled, pulverized, or reduced to powder by hand pressure. It should be noted that in accordance with the Occupational Safety and Health Administration (OSHA), Asbestos Construction Standard 29 CFR 1926.1101, any thermal system insulation, surfacing materials, floor tiles, roofing felts and shingles found in buildings constructed no later than January 1, 1981 are presumed asbestos containing materials.

3.1. Limitations to the ACM Survey

Bureau Veritas inspected all reasonable accessible spaces of the building, including basements, storage rooms, utility rooms, attics, and crawl spaces.

Areas that were not accessible without significantly destructive methods (fire doors) or that were contained within non-functional building spaces or were part of energized equipment (boilers, air handlers, electrical, etc.) were not inspected. ACM in non-functional spaces would not typically be expected to pose a hazard to human health or the environment as long as these materials remain enclosed, are not part of the circulating air system and are inaccessible to the building occupants.

Suspected ACM subsequently identified or encountered in non-functional, inaccessible areas during demolition should be assumed to contain asbestos unless testing confirms otherwise. In addition, all flooring materials were not sampled under the scope of this inspection and therefore assumed asbestos containing materials.

Roofing materials were not sampled at the time of the assessment because roof sampling would invalidate existing roof warranties. Fire doors were not sampled because the damage caused by sampling would render these materials friable and may also void the fire rating. Flexible fabric vibration isolators were not sampled because the damage caused by sampling would render these materials friable and may cause a fiber release into the tempered air supply ducting. Since these materials were not sampled, they should be assumed to be asbestos-containing, unless sampled and proven otherwise. Sampling of these assumed ACMs should be performed prior to any renovation or other activity that may cause a material disturbance.

3.2. Survey and Sample Collection Procedure

The Asbestos Inspection was performed on May 22 through June 16, 2023. The inspection consisted of a walk-through and visual observations of the accessible interior areas for suspect ACM, assessing the ACM for condition, friability, and the collection of bulk samples.

Samples of suspect ACM were taken in accordance with USEPA protocol and were collected by Michael Rombke who is an Ohio Licensed Asbestos Inspector. A total of one thousand five hundred six (1,506) bulk samples were collected and analyzed to facilitate the inspection. All samples were transported for analysis to Schneider Laboratories Global, Inc., and Pinnacle Consultants both of which are accredited by the American Industrial Hygiene Association (AIHA) and successfully participates in the National Voluntary Laboratory Accreditation Program (NVLAP). Rigorous chain-of-custody guidelines were followed to ensure proper handling and delivery of the samples.

The samples were analyzed for asbestos by polarized light microscopy (PLM) in accordance with the "EPA Method for the Determination of Asbestos in Bulk Building Materials." Analysis was performed by using the bulk sample for visual observation and slide preparation, and for microscopic examination and identification. The samples were mounted on slides and then analyzed for asbestos (chrysotile, amosite, crocidolite, anthophyllite, actinolite/tremolite), and fibrous non-asbestos constituents (mineral wool, fiberglass, cellulose, etc.). Asbestos was identified by refractive indices, morphology, color, and signs of elongation. The same characteristics were used to identify the non-asbestos constituents. The microscopist visually estimated relative amounts of each constituent by determining the volume of each constituent in proportion to the total volume of the sample, using a stereoscope.

During the inspection, location and friability of each suspect material were recorded.

3.3. Summary of Laboratory Results

3.3.1. ASBESTOS-CONTAINING MATERIALS

The table below describes materials that were sampled as part of the inspection and found to contain asbestos by laboratory analysis via PLM. Sample numbers presented in the tables correspond to the sample numbers on the Laboratory Analysis Reports, which are included in Appendix A. Also presented below are the assessed friability, condition, and approximate quantity for each identified ACM.

Nelson Park Apartments 1994 Maryland Avenue, Columbus, Ohio 43219 ACM						
Sample Number	Material Description	Location	Friable	% Asbestos	Condition	Estimated Quantity
Building 1 Units 500 - 506						
1433, 1434, 1435	Paper Wrap on Duct	Unit 500 - Front Bedroom in Wall	Yes	40% Chrysotile	Intact	4 SF
1436	Paper Wrap on Duct	Unit 500 - Front Bedroom in Ceiling	Yes	40% Chrysotile	Intact	10 SF
1449	Joint Compound	Unit 502 – Furnace Room	Yes	2% Chrysotile	Intact	4 LF
Building 2 Units 494, 496 and 1864						
1483	Paper Tape	Unit 494 – Furnace Room Duct	Yes	60% Chrysotile	Intact	12 SF
1491	Drywall and Joint Compound	Unit 496 – Furnace Room Wall	Yes	2% Chrysotile	Intact	108 SF
Building 3 Units 1872 to 1878						
1520	Paper Tape	Unit 1872 – Furnace Room Duct	Yes	60% Chrysotile	Intact	4 SF
1521	Vibration Joint	Unit 1874 – Furnace Room Duct	Yes	60% Chrysotile	Intact	4 SF

Building 4 Units 1900 to 1906						
1552	Paper Tape	Unit 1906 – Duct in Bathroom Floor	Yes	60% Chrysotile	Intact	2 SF
1564	Paper Wrap	Unit 1902 – Duct in Front Room Floor	Yes	45% Chrysotile	Intact	2 SF
Building 5 Units 1912 to 1918						
1582	Paper Wrap	Unit 1914 - Duct in Bedroom - 1	Yes	60% Chrysotile	Intact	2 SF
1594	Paper	Unit 1914 – Duct Inside Wall Bedroom 2	Yes	60% Chrysotile	Intact	2 SF
2880	Exterior Caulk	Unit 1916	No	2% Chrysotile	Intact	570 LF
Building 6 Units 1922 to 1928						
1622	Paper Tape	Unit 1924 – Duct in Bedroom 1	Yes	60% Chrysotile	Intact	2 SF
1634	Paper Wrap	Unit 1924 – Duct Inside Wall Bedroom 2	Yes	60% Chrysotile	Intact	20 SF
Building 7 Units 1934 – A, B, C, D						
1654	Paper Tape	Unit B – Furnace Room Duct	Yes	40% Chrysotile	Intact	2 SF
1664	Paper Wrap	Unit B – Duct in Bedroom	Yes	40% Chrysotile	Intact	2 SF
2883	Exterior Caulk	Unit 1934 – Window	No	2% Chrysotile	Intact	570 LF

Building 8 Units 1938 – A, B, C, D						
1744	Drywall Tape Joint Compound	Unit D – Bedroom 1 Wall	Yes	2% Chrysotile	Intact	108 SF
1752	Paper Tape	Unit A – Bedroom 1 Duct	Yes	60% Chrysotile	Intact	2 SF
1764	Paper Wrap on Duct	Unit B – 3 rd Floor Bedroom	Yes	60% Chrysotile	Intact	2 SF
Building 9 Units 1940 – A, B, C, D						
1714	Drywall Tape and Joint Compound	Unit A – Living Room Closet Wall	Yes	2% Chrysotile	Intact	108 SF
1716	Drywall Composite	Unit A – Living Room Closet Wal	Yes	2% Chrysotile	Intact	108 SF
1716	Drywall Composite 2 nd layer	Unit A – Living Room Closet Wal	Yes	<1% Chrysotile	Intact	108 SF
1722	Paper Tape	Unit D – Bedroom 1 Duct	Yes	60% Chrysotile	Intact	4 SF
1724	Vibration Joint	Unit D – Furnace Room Duct	Yes	60% Chrysotile	Intact	4 SF
1734	Paper Wrap on Duct	Unit D – Bedroom Room 2 Inside Wall	Yes	60% Chrysotile	Intact	2 SF
2888	Exterior Caulk	Unit D – Door	No	2% Chrysotile	Intact	570 LF

Building 10 – 1942 – A, B, C, D						
1674	Drywall Tape and Joint Compound	Unit D – Bedroom 1 Wall	Yes	2% Chrysotile	Intact	441 SF
1682	Paper Tape	Unit A – Furnace Room on Duct	Yes	60% Chrysotile	Intact	4 SF
1697	Very Rough Texture on Drywall	Unit A – Bedroom 1	Yes	60% Chrysotile	Intact	441 SF
2890	Exterior Caulk	Unit B – Door	No	2% Chrysotile	Intact	570 LF
Building 11 Unit 1950 - 1956						
1771	Drywall Tape and Compound	Unit 1950 – Living Room Wall	Yes	2% Chrysotile	Intact	1320 SF
1782	Paper Tape	Unit 1950 – Bath Duct	Yes	60% Chrysotile	Intact	2 SF
1784	Vibration Tape	Unit 1950 – Furnace Room on Duct	Yes	60% Chrysotile	Intact	4 SF
1794	Paper Wrap on Duct	Unit 1950 – Bedroom 2 in Wall	Yes	60% Chrysotile	Intact	20 SF
Building 12 – 1958 – A, B, C, D						
1812	Paper Tape	Unit D – Bedroom 1 Duct	Yes	60% Chrysotile	Intact	2 SF

The USEPA and State of Ohio define asbestos-containing materials (ACM) as those which contain greater than one percent asbestos. Of the one thousand five hundred six (1,506) samples that were analyzed, one hundred seventy-two (172) materials were found to contain asbestos.

3.3.2. NON-ASBESTOS MATERIALS

The table below describes the materials that were sampled as part of the inspection at the Project and found not to contain asbestos by laboratory analysis via PLM. Sample numbers presented in the tables correspond to the sample numbers on the Laboratory Analysis Reports, which are included in Appendix A.

Nelson Park Apartments 1994 Maryland Avenue, Columbus, Ohio 43219 Negative Materials			
Sample Number	Material	Friable/Non-Friable	Condition
Building 1 Units 500 - 506			
1431, 1432, 1438, 1439, 1440	White Joint Compound	Friable	Intact
1437, 1448	Brown Cove Base and associated Mastic	Non-Friable	Intact
1441, 1446	Gray Blow-In Insulation	Friable	Intact
1442, 1447	Brown Blow-In Insulation	Friable	Intact
1443	Drywall Texture	Friable	Intact
1444, 1445, 1455, 1456	Rough Drywall Texture	Friable	Intact
1450, 1451, 1459, 1460, 1461	Drywall	Friable	Intact
1453, 1454	Ceiling Texture	Friable	Intact
1458, 1462	Vibration Joint	Non-Friable	Intact
2871, 2872	Exterior Caulk	Non-Friable	Intact

Building 2 Units 494, 496 and 1864			
1471, 1472, 1473, 1494, 1495	Ceiling Texture	Friable	Intact
1474, 1475, 1476, 1477, 1496, 1497, 1498	Drywall Texture	Friable	Intact
1478, 1479	Gray Blow-In Insulation	Friable	Intact
1480, 1481, 1482, 1492, 1493	Drywall and Compound	Friable	Intact
1484, 1489	Vibration Joint	Friable	Intact
1485, 1486	Brown Blow-In Insulation	Friable	Intact
1487, 1499	Brown Cove Base and associated Mastic	Non-Friable	Intact
1488, 1500	White Interior Caulk	Non-Friable	Intact
2873, 2874	Exterior Caulk	Non-Friable	Intact
Building 3 Units 1872 to 1878			
1501, 1502, 1503, 1504, 1505, 1506, 1507	Drywall Texture	Friable	Intact
1508, 1509, 1510, 1511, 1512	Ceiling Texture	Friable	Intact
1513, 1514, 1515, 1516, 1517, 1518	Drywall Tape and Compound	Friable	Intact
1523, 1524	White Interior Caulk	Non-Friable	Intact
1525, 1526	Brown Cove Base	Non-Friable	Intact
1527, 1528	Gray Blow-In Insulation	Friable	Intact
1529, 1530	Brown Blow-In Insulation	Friable	Intact
2875, 2875	Exterior Caulk	Non-Friable	Intact

Building 4 Units 1900 to 1906			
1541, 1542, 1543, 1544, 1545, 1546	Drywall Tape and Compound	Friable	Intact
1547, 1548, 1549, 1550, 1551, 1567, 1568, 1569	Ceiling Texture	Friable	Intact
1554, 1555	Vibration Joint	Friable	Intact
1558, 1559	Brown Cove Base	Non-Friable	Intact
1560, 1561	Gray Blow-In Insulation	Friable	Intact
1562, 1563	Brown Blow-In Insulation	Friable	Intact
2877, 2878	Exterior Caulk	Non-Friable	Intact
Building 5 Units 1912 to 1918			
1571, 1573, 1575, 1576	Drywall Tape and Compound	Friable	Intact
1572, 1575	Drywall Board	Friable	Intact
1577, 1578, 1579, 1580, 1581	Ceiling Texture	Friable	Intact
1584, 1585	Vibration Joint	Friable	Intact
1586, 1587	White Interior Caulk	Non-Friable	Intact
1588, 1589	Gray Blow-In Insulation	Friable	Intact
1590, 1591	Brown Blow-In Insulation	Friable	Intact
1592, 1593	Brown Cove Base	Non-Friable	Intact
1597, 1598, 1599, 1600, 1601	Drywall Texture	Friable	Intact

Building 6 Units 1922 to 1928			
1611, 1613	Drywall Tape and Compound	Friable	Intact
1614, 1616	Drywall Composite	Friable	Intact
1612, 1615	Drywall Board	Friable	Intact
1617, 1618, 1619, 1620, 1621	Ceiling Texture	Friable	Intact
1624, 1625	Vibration Joint	Friable	Intact
1626, 1627	White Interior Caulk	Non-Friable	Intact
1628, 1629	Gray Blow-In Insulation	Friable	Intact
1630, 1631	Brown Blow-In Insulation	Friable	Intact
1632, 1633	Brown Cove Base	Non-Friable	Intact
2881, 2882	Exterior Caulk	Non-Friable	Intact
Building 7 Units 1934 – A, B, C, D			
1641, 1643	Drywall Tape and Compound	Friable	Intact
1644, 1646	Drywall Composite	Friable	Intact
1642, 1645	Drywall Board	Friable	Intact
1647, 1648, 1649, 1650, 1651	Ceiling Texture	Friable	Intact
1654, 1655	Vibration Joint	Friable	Intact
1656, 1657	White Interior Caulk	Non-Friable	Intact
1658, 1659	Gray Blow-In Insulation	Friable	Intact
1660, 1661	Brown Blow-In Insulation	Friable	Intact
1622, 1663	Brown Cove Base	Non-Friable	Intact

Building 8 Units 1938 – A, B, C, D			
1742, 1743	Drywall Board	Friable	Intact
1745, 1746	Drywall Composite	Friable	Intact
1747, 1748, 1749, 1750, 1751	Ceiling Texture	Friable	Intact
1754, 1755	Vibration Joint	Friable	Intact
1756, 1757	White Interior Caulk	Non-Friable	Intact
1758, 1759	Gray Blow-In Insulation	Friable	Intact
1760, 1761	Brown Blow-In Insulation	Friable	Intact
1762, 1763	Brown Cove Base	Non-Friable	Intact
2885, 2886	Exterior Caulk	Non-Friable	Intact
Building 9 Units 1940 – A, B, C, D			
1711, 1714	Drywall Tape and Compound	Friable	Intact
1712, 1715	Drywall Board	Friable	Intact
1717, 1718, 1719, 1720, 1721	Ceiling Texture	Friable	Intact
1726, 1727	White Interior Caulk	Non-Friable	Intact
1728, 1729	Gray Blow-In Insulation	Friable	Intact
1730, 1731	Brown Blow-In Insulation	Friable	Intact
1732, 1733	White Cove Base	Non-Friable	Intact

Building 10 – 1942 – A, B, C, D			
1671, 1674	Drywall Tape and Compound	Friable	Intact
1672, 1675	Drywall Board	Friable	Intact
1673, 1676	Drywall Composite	Friable	Intact
1677, 1678, 1679, 1680	Ceiling Texture	Friable	Intact
1684, 1685	Vibration Joint	Friable	Intact
1686, 1687	White Interior Caulk	Non-Friable	Intact
1688, 1689	Gray Blow-In Insulation	Friable	Intact
1690, 1691	Brown Blow-In Insulation	Friable	Intact
1692, 1693	Brown Cove Base	Non-Friable	Intact
1694, 1695, 1696	Paper Wrap on Duct	Friable	Intact
1700, 1701, 1702, 1703, 1704	Texture on Drywall	Friable	Intact
Building 11 Unit 1950 - 1956			
1772, 1775	Drywall Board	Friable	Intact
1773, 1776	Drywall Composite	Friable	Intact
1777, 1778, 1779, 1780, 1781	Ceiling Texture	Friable	Intact
1786, 1787	White Interior Caulk	Non-Friable	Intact
1788, 1789	Gray Blow-In Insulation	Friable	Intact
1790, 1791	Brown Blow-In Insulation	Friable	Intact
1792, 1793	Brown Cove Base	Non-Friable	Intact
2891, 2892	Exterior Caulk	Non-Friable	Intact

Building 12 – 1958 – A, B, C, D			
1801, 1803	Drywall Tape and Compound	Friable	Intact
1804, 1806	Drywall Composite	Friable	Intact
1802, 1805	Drywall Board	Friable	Intact
1807, 1808, 1809, 1810, 1811	Ceiling Texture	Friable	Intact
1812, 1813	Paper Tape	Friable	Intact
1816, 1817	White Interior Caulk	Non-Friable	Intact
1818, 1819	Gray Blow-In Insulation	Friable	Intact
1820, 1821	Brown Blow-In Insulation	Friable	Intact
1822, 1823	Brown Cove Base	Non-Friable	Intact
1824, 1825, 1826	Paper Wrap on Duct	Friable	Intact
Building 13 – 1960 – A, B, C, D			
1832, 1833	Dry Board	Friable	Intact
1835, 1836	Drywall Composite	Friable	Intact
1837, 1838	White Interior Caulk	Non-Friable	Intact
1839, 1840	Brown Cove Base	Non-Friable	Intact
1841, 1842, 1843, 1844, 1845	Ceiling Texture	Friable	Intact
1851, 1852	Paper Wrap on Duct	Friable	Intact
1853, 1854	Gray Blow-In Insulation	Friable	Intact
1855, 1856	Brown Blow-In Insulation	Friable	Intact
1857, 1858, 1859	Rough Texture on Drywall	Friable	Intact

Building 14 – 1962 – A, B, C, D			
1862, 1865	Drywall Board	Friable	Intact
1867, 1868	White Interior Caulk	Non-Friable	Intact
1869, 1870	Brown Cove Base	Non-Friable	Intact
1871, 1872, 1873, 1874, 1875	Ceiling Texture	Friable	Intact
1876, 1877	Vibration Joint	Friable	Intact
1881, 1882	Paper Wrap on Duct	Friable	Intact
1883, 1884	Gray Blow-In Insulation	Friable	Intact
1885, 1886	Brown Blow-In Insulation	Friable	Intact
1887, 1888, 1889	Rough Texture on Wall	Friable	Intact
Building 15 – 1964, 1966, 1970, 1972			
1891, 1893	Drywall Tape and Compound	Friable	Intact
1894, 1896	Drywall Composite	Friable	Intact
1892, 1895	Drywall Board	Friable	Intact
1897, 1898	White Interior Caulk	Non-Friable	Intact
1899, 1900	Brown Cove Base	Non-Friable	Intact
1901, 1902, 1903, 1904, 1905	Ceiling Texture	Friable	Intact
1906, 1907	Vibration Joint	Friable	Intact
1911, 1912	Paper Wrap on Duct	Friable	Intact
1913, 1914	Gray Blow-In Insulation	Friable	Intact
1915, 1916	Brown Blow-In Insulation	Friable	Intact

Building 16 – 1978 – A, B, C, D			
1922, 1925	Drywall Board	Friable	Intact
1927, 1928	White Interior Caulk	Non-Friable	Intact
1929, 1930	Brown Cove Base	Non-Friable	Intact
1931, 1932, 1933, 1934, 1935	Ceiling Texture	Friable	Intact
1936, 1937	Vibration Joint	Friable	Intact
1941, 1942	Paper Wrap on Duct	Friable	Intact
1943, 1944	Gray Blow-In Insulation	Friable	Intact
1945, 1946	Brown Blow-In Insulation	Friable	Intact
1947, 1948, 1949, 1950, 1951, 1952, 1953	Rough Texture on Drywall	Friable	Intact
2901, 2902	Exterior Caulk	Non-Friable	Intact
Building 17 – 1982 – A, B, C, D			
1962, 1965	Drywall Board	Friable	Intact
1967, 1968	White Interior Caulk	Non-Friable	Intact
1969, 1970	Brown Cove Base	Non-Friable	Intact
1971, 1972, 1973, 1974, 1975	Ceiling Texture	Friable	Intact
1976, 1977	Vibration Joint	Friable	Intact
1981, 1982	Paper Wrap on Duct	Friable	Intact
1983, 1984, 1985, 1986, 1987, 1988, 1989	Rough Texture on Drywall	Friable	Intact

Building 18– 1984 – A, B, C, D			
1922, 1995	Drywall Board	Friable	Intact
1993, 1996	Drywall Composite	Friable	Intact
1997, 1998	White Interior Caulk	Non-Friable	Intact
1999, 200	Cove Base	Non-Friable	Intact
2001, 2002, 2003, 2004, 2005	Ceiling Texture	Friable	Intact
2006, 2007	Vibration Joint	Friable	Intact
2011, 2012	Paper Wrap on Duct	Friable	Intact
2013, 2014	Gray Blow-In Insulation	Friable	Intact
2015, 2016, 2017, 2018, 2019, 2020	Rough Texture on Drywall	Friable	Intact
Building 19– 1986 – A, B, C, D			
2032, 2035	Drywall Board	Friable	Intact
2033, 2036	Drywall Composite	Friable	Intact
2037, 2038	Vibration Joint	Friable	Intact
2041, 2042, 2043, 2044, 2045	Ceiling Texture	Friable	Intact
2046, 2047, 2048, 2049, 2050, 2051	Rough Texture on Drywall	Friable	Intact
2907, 2908	Exterior Caulk	Non-Friable	Intact

Building 20 – 2004 – A, B, C, D			
2062, 2065	Drywall Board	Friable	Intact
2063, 2066	Drywall Composite	Friable	Intact
2067, 2068	White Interior Caulk	Non-Friable	Intact
2069, 2070	Cove Base	Non-Friable	Intact
2071, 2072, 2073, 2074, 2075	Ceiling Texture	Friable	Intact
2076, 2077	Vibration Joint	Friable	Intact
2082, 2083	Gray Blow-In Insulation	Friable	Intact
2084, 2085, 2086, 2087, 2088, 2089, 2090	Rough Texture on Drywall	Friable	Intact
Building 21 – 2006 – A, B, C, D			
2092, 2095	Drywall Board	Friable	Intact
2093, 2096	Drywall Composite	Friable	Intact
2097, 2098	White Interior Caulk	Non-Friable	Intact
2099, 2100	Cove Base	Non-Friable	Intact
2101, 2102, 2103, 2104, 2105	Ceiling Texture	Friable	Intact
2106, 2107	Vibration Joint	Friable	Intact
2112, 2113, 2114, 2115, 2116, 2117, 2118	Rough Ceiling Texture	Friable	Intact
2119, 2120	Brown Blown-In Insulation	Friable	Intact
2121, 2122	Gray Blow-In Insulation	Friable	Intact
2913, 2914	Exterior Caulk	Non-Friable	Intact

Building 22 – 2010 – A, B, C, D			
2132, 2135	Drywall Board	Friable	Intact
2137, 2138	White Interior Caulk	Non-Friable	Intact
2139, 2140	Cove Base	Non-Friable	Intact
2141, 2142, 2143, 2144, 2145	Ceiling Texture	Friable	Intact
2146, 2147	Vibration Joint	Friable	Intact
2152, 2153, 2154, 2155, 2156, 2157, 2158	Rough Texture on Drywall	Friable	Intact
Building 23 – 2014 – A, B, C, D			
2162, 2165	Drywall Board	Friable	Intact
2163, 2166	Drywall Composite	Friable	Intact
2167, 2168	White Interior Caulk	Non-Friable	Intact
2169, 2170	Cove Base	Non-Friable	Intact
2171, 2172, 2173, 2174, 2175	Ceiling Texture	Friable	Intact
2176, 2177	Vibration Joint	Friable	Intact
2182, 2183, 2184, 2185, 2186, 2187, 2188	Rough Texture on Drywall	Friable	Intact
2189, 2190	Brown Blow-In Insulation	Friable	Intact

Building 24 – 2020, 2022, 2024, 2026			
2192, 2195	Drywall Board	Friable	Intact
2193, 2196	Drywall Composite	Friable	Intact
2197, 2198	White Interior Caulk	Non-Friable	Intact
2199, 2200	White Cove Base	Non-Friable	Intact
2201, 2202, 2203, 2204, 2205	Ceiling Texture	Friable	Intact
2206, 2207	Vibration Joint	Friable	Intact
2212, 2213, 2214, 2215, 2216, 2217, 2218	Rough Texture on Drywall	Friable	Intact
2219, 2220	Brown Blow-In Insulation	Friable	Intact
2221, 2222	Gray Blow-In Insulation	Friable	Intact
Building 25 – 2032 – A, B, C, D			
2232, 2235	Drywall Board	Friable	Intact
2233, 2236	Drywall Composite	Friable	Intact
2237, 2238	White Interior Caulk	Non-Friable	Intact
2239, 2240	Brown Cove Base	Non-Friable	Intact
2241, 2242, 2243, 2244, 2245	Texture on Ceiling	Friable	Intact
2246, 2247	Vibration Joint	Friable	Intact
2252, 2253, 2254, 2255, 2256, 2257, 2258	Rough Texture on Drywall	Friable	Intact
2259, 2260	Brown Blow-In Insulation	Friable	Intact
2261, 2262	Gray Blow-In Insulation	Friable	Intact

Building 26 – 2038 – A, B, C, D			
2272, 2275	Drywall Board	Friable	Intact
2273, 2276	Drywall Composite	Friable	Intact
2277, 2278	White Interior Caulk	Non-Friable	Intact
2279, 2280	Cove Base	Non-Friable	Intact
2281, 2282, 2283, 2284, 2285	Ceiling Texture	Friable	Intact
2286, 2287	Vibration Joint	Friable	Intact
2292, 2293, 2294, 2295, 2296, 2297, 2298	Rough Texture on Drywall	Friable	Intact
2923, 2924	Exterior Caulk	Non-Friable	Intact
Building 27 – 2040 – A, B, C, D			
2302, 2395	Drywall Board	Friable	Intact
2303, 2306	Drywall Composite	Friable	Intact
2307, 2308	White Interior Caulk	Non-Friable	Intact
2309, 2310	Cove Base	Non-Friable	Intact
2311, 2313, 2314, 2315	Ceiling Texture	Friable	Intact
2316, 2317	Vibration Joint	Friable	Intact
2322, 2323, 2324, 2325, 2326, 2327, 2328	Rough Texture on Drywall	Friable	Intact
2925, 2926	Exterior Caulk	Non-Friable	Intact

Building 28 – 2050, 2052, 2054, 2056			
2332, 2335	Drywall Board	Friable	Intact
2333, 2336	Drywall Composite	Friable	Intact
2337, 2338	White Interior Caulk	Non-Friable	Intact
2330, 2340	Cove Base	Non-Friable	Intact
2341, 2342, 2343, 2344, 2345	Ceiling Texture	Friable	Intact
2346, 2347	Vibration Joint	Friable	Intact
2352, 2353, 2354, 2355, 2356, 2357, 2358	Rough Texture on Drywall	Friable	Intact
Building 29 – 2058 – A, B, C, D			
2362, 2365	Drywall Board	Friable	Intact
2363, 2366	Drywall Composite	Friable	Intact
2367, 2368	White Interior Caulk	Non-Friable	Intact
2369, 2370	Cove Base	Non-Friable	Intact
2371, 2372, 2374, 2375	Ceiling Texture	Friable	Intact
2376, 2377	Vibration Joint	Friable	Intact
2382, 2383, 2384, 2385, 2386, 2387, 2388	Rough Texture on Drywall	Friable	Intact
2929, 2930	Exterior Caulk	Non-Friable	Intact

Building 30 – 2060 – A, B, C, D			
2392, 2395	Drywall Board	Friable	Intact
2393, 2396	Drywall Composite	Friable	Intact
2397, 2398	White Interior Caulk	Non-Friable	Intact
2399, 2400	Cove Base	Non-Friable	Intact
2401, 2402, 2403, 2404, 2405	Ceiling Texture	Friable	Intact
2406, 2407	Vibration Joint	Friable	Intact
Building 31 – 2062 – A, B, C, D			
2422, 2425	Drywall Board	Friable	Intact
2427, 2428	White Interior Caulk	Non-Friable	Intact
2429, 2430	Brown Cove Base	Non-Friable	Intact
2431, 2432, 2433, 2434, 2435	Ceiling Texture	Friable	Intact
2442, 2443, 2444	Gray Blow-In Insulation	Friable	Intact
Building 32 – 2064, 2066, 2068, 2070			
2452, 2455	Drywall Board	Friable	Intact
2457, 2458	White Interior Caulk	Non-Friable	Intact
2459, 2460	Cove Base	Non-Friable	Intact
2461, 2462, 2463, 2464, 2465	Ceiling Texture	Friable	Intact
2470, 2472	Paper Wrap on Duct	Friable	Intact

Building 33 – 2078 – A, B, C, D			
2482, 2485	Drywall Board	Friable	Intact
2483, 2486	Drywall Composite	Friable	Intact
2487, 2488	White Interior Caulk	Non-Friable	Intact
2489, 2490	Brown Cove Base	Non-Friable	Intact
2491, 2492, 2493, 2494, 2495	Ceiling Texture	Friable	Intact
2496, 2497	Vibration Joint	Friable	Intact
1529, 1530	Brown Blow-In Insulation	Friable	Intact
Building 34 – 2082 – A, B, C, D			
2512, 2515	Drywall Board	Friable	Intact
2513, 1526	Drywall Composite	Friable	Intact
2517, 2518	White Interior Caulk	Non-Friable	Intact
2519, 2520	Cove Base	Non-Friable	Intact

4. Conclusions and Recommendations

On May 22 through June 16, 2023, Bureau Veritas completed this Asbestos Inspection of Nelson Park Apartments (the "Project"), located at 1994 Maryland Avenue in Columbus, Ohio. A total of one thousand five hundred six (1,506) bulk samples with laboratory analysis of bulk samples showing asbestos to be present (>1% by weight) in one hundred seventy-two (172) samples. <1% Asbestos was detected in eight (8) materials.

Bulk samples were collected and analyzed to facilitate the inspection.

The following were identified as friable asbestos-containing materials identified on the property:

- Paper wrap on duct
- Drywall tape and compound
- Vibration Joint
- Paper tape on duct
- Rough texture on drywall
- Drywall composite

The following were identified as non-friable asbestos-containing materials identified on the property:

- Cove Base
- Exterior caulk

The following were identified to contain less than one percent asbestos:

- Drywall composite
- Rough texture on drywall

The remaining materials were found to have no asbestos detected by laboratory analysis via PLM.

4.1. Recommendations

Bureau Veritas offers the following recommendations:

- If any ACMs are friable or will be disturbed as a result of renovation or demolition activities they should be removed by a State of Ohio certified asbestos abatement contractor prior to disturbance. Any such abatement projects should be monitored by a qualified industrial hygiene firm for worker and environmental safety.
- Any ACMs that will not be disturbed should be managed in place using an O&M Program. This should include, at a minimum repair of damaged ACM's. As part of an O&M Program any contractors bidding on or performing work in the area should be made aware of the presence and locations of ACM's.
- Any repair and maintenance activities where the ACM is going to be disturbed and may release fibers must be performed by personnel with a minimum of 16-hour OSHA Class III training. Any maintenance or custodial activities where ACM may be contacted but will not likely be disturbed should be performed by personnel with a minimum of 2 hour OSHA Class IV training. All training should comply with 29 CFR 1926.1101(k)(9)(vi)

Reporting Limit: 1% Gravimetrically Reduced Reporting Limit: 0.01% PLM analysis is based on Visual Estimation and NESHAP recommends that any friable sample with an asbestos content less than 10 percent be verified by Point Count or TEM Analysis. The EPA recommends that any attic loose fill vermiculite should be treated as asbestos containing material. This report must not be reproduced except in full with the approval of the laboratory. The test results apply to the sample as received.

RE: Bldg 13 1960 - A,B,C,D

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to the items as received and makes no statement as to the contents of surrounding materials.. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to the items as received and makes no statement as to the contents of surrounding materials.. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to the items as received and makes no statement as to the contents of surrounding materials. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to the items as received and makes no statement as to the contents of surrounding materials. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

 Microscopy Supervisor/Analyst

Reporting Limit: 1% Gravimetrically Reduced Reporting Limit: 0.01% PLM analysis is based on Visual Estimation and NESHAP recommends that any friable sample with an asbestos content less than 10 percent be verified by Point Count or TEM Analysis. The EPA recommends that any attic loose fill vermiculite should be treated as asbestos containing material. This report must not be reproduced except in full with the approval of the laboratory. The test results apply to the sample as received.

Reporting Limit: 1% Gravimetrically Reduced Reporting Limit: 0.01% PLM analysis is based on Visual Estimation and NESHAP recommends that any friable sample with an asbestos content less than 10 percent be verified by Point Count or TEM Analysis. The EPA recommends that any attic loose fill vermiculite should be treated as asbestos containing material. This report must not be reproduced except in full with the approval of the laboratory. The test results apply to the sample as received.

Project: Nelson Park Apartments

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to the items as received and makes no statement as to the contents of surrounding materials. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to the items as received and makes no statement as to the contents of surrounding materials. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

RE: Nelson Park 455, 457, 459, 461

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to the items as received and makes no statement as to the contents of surrounding materials.. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to the items as received and makes no statement as to the contents of surrounding materials. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

RE: Nelson Park 2010 - A, B, C, D

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to the items as received and makes no statement as to the contents of surrounding materials.. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to the items as received and makes no statement as to the contents of surrounding materials. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to the items as received and makes no statement as to the contents of surrounding materials.. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to items tested and makes no statement as to the contents of surrounding materials and apply to the sample as received. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

RE: Nelson Park 2050,2052,2054,2056

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to items tested and makes no statement as to the contents of surrounding materials and apply to the sample as received. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to items tested and makes no statement as to the contents of surrounding materials and apply to the sample as received. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to the items as received and makes no statement as to the contents of surrounding materials.. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

RE: Nelson Park 2084 - A, B, C, D

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to the items as received and makes no statement as to the contents of surrounding materials.. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

RE: Nelson Park 2090 - 2092 - 2094 - 2096 All One Bldg.

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to the items as received and makes no statement as to the contents of surrounding materials.. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

RE: Nelson Park 2100 - A, B, C, D

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to the items as received and makes no statement as to the contents of surrounding materials.. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to the items as received and makes no statement as to the contents of surrounding materials. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

RE: Nelson Park 2106, 2108, 2110, 2112 4 Unit Building

Analytical Method: Polarized light microscopy using dispersion staining (App. E to Sub. E of 40 CFR Part 763 and EPA/600/R-93/116). PLM should not be used to demonstrate the absence of asbestos in floor tiles. All samples will be held for thirty (30) days unless otherwise requested. This report relates only to the items as received and makes no statement as to the contents of surrounding materials.. Multi-layered material which have distinct and separable layers shall be reported separately. This report shall not be reproduced, except in full, without written permission. The results of this report should not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

RE: Evaluation Specialist
Certification Number: ES34635
Expiration Date: 1/31/2024

Dear Mike Rombke:

This letter and enclosed certification card approves your request to be certified as an asbestos Evaluation Specialist. You must present your card upon request at any project site while performing duties. Copies of cards are not acceptable as proof of certification.

This certification may be revoked by the Director of the Ohio Environmental Protection Agency (EPA) for violation of any of the requirements of 3745-22 or 3745-20 of the Ohio Administrative Code.

If you have any questions, please contact the Asbestos Program at 614-644-0226 or by email at asbestoslicensing@epa.ohio.gov.

Sincerely,

Brandon M. Schwendeman

1. Executive Summary and Certification

Bureau Veritas has completed an Asbestos Operations and Maintenance (O&M) Program report for the Nelson Park Apartments, which is located at 1994 Maryland Avenue in Columbus, Ohio 43219. Bureau Veritas previously performed an Environmental Site Assessment at the property (Bureau Veritas Project No. 156846.22R000-001.129). In the prior report, Bureau Veritas stated that:

- The Project, originally constructed in 1958, is currently developed as a multi-family residential community, comprised of 45 two-story buildings, with 177 units.

This O&M Plan is based on the following recommendation found in that report:

- Any ACMs that will not be disturbed should be managed in place using an O&M Program. This should include, at a minimum repair of damaged ACM's. As part of an O&M Program any contractors bidding on or performing work in the area should be made aware of the presence and locations of ACM's.

The O&M Program report, which was prepared at the Client's request, utilizes methods and procedures consistent with good commercial or customary practice designed to conform to acceptable industry standards and applicable federal, state, and local regulations. Furthermore, the O&M Program preparer, listed below, is professionally trained, experienced, and qualified in accordance with industry standards to complete this O&M Program report.

The independent conclusions represent Bureau Veritas's best professional judgment based on information and data available to us during the course of this assignment. Factual information regarding operations, conditions, and test data provided by the Client, owner, or their representative have been assumed to be correct and complete. Additionally, the conclusions presented are based on the conditions that existed and the information available at the time of the assignment.

Prepared by Bureau Veritas:

Gregory P. Shingler
Hazard Evaluation Specialist (Ohio)
Technical Report Reviewer
Bureau Veritas

2. Introduction

This General Operations and Maintenance (O&M) Program established by Bureau Veritas is for a property known as the Nelson Park Apartments, which contains asbestos-containing materials (ACMs) or Presumed/Assumed asbestos-containing materials (PACM¹). This O&M Program covers ACMs/PACMs that are in good condition and are non-friable, and/or of the type defined as miscellaneous by the Environmental Protection Agency (EPA)².

The purpose of this Program is to minimize the risk of exposure to building occupants by maintaining existing ACMs/PACMs in good condition. Existing friable asbestos hazard conditions must be addressed by remediation procedures that are beyond the scope of this O&M Program. Such remediation activities should be conducted by licensed asbestos contractors (See Section 4.4).

Part of the O&M Plan includes the appointment of an Asbestos Program Manager (APM). The position of the APM is frequently held by the building engineer, superintendent, facilities manager, or safety and health director. Regardless of who holds the position of APM, the EPA strongly recommends that the APM be properly qualified through training and experience (refer to Section 4.1).

Nonetheless, the Asbestos Program Manager (APM) should ensure that activities of asbestos contractors follow applicable regulatory requirements and guidelines (as briefly discussed in Section 5).

This O&M Program has been designed to minimize the potential release of asbestos fibers during general work activities, scheduled maintenance and renovation of the building. This Program is designed utilizing the EPA's Document, *Managing Asbestos in Place; A Building Owner's Guide to Operations and Maintenance Programs For Asbestos-Containing Materials* and the National Institute of Building Sciences (NIBS) *Guidance Manual: Asbestos Operations and Maintenance Work Practices*.

Abbreviations and acronyms that are used in this O&M Program are defined in Appendix I-Glossary, located at end of this document.

This Program encompasses Class III and Class IV Asbestos Work (based on OSHA asbestos work classifications found in 29 CFR 1926.1101). In addition to the following *Class IV Asbestos Work* definition, further differentiation between acceptable and unacceptable O&M activities is provided in Section 8.0 (O&M Work Practices). Class III and Class IV Asbestos Work are defined as follows:

- **Class III Asbestos Work:** Repair and maintenance operations, where ACM is likely to be disturbed. This disturbance includes cutting away small amounts of ACM, no greater than the amount that can be contained in one standard sized glovebag or waste bag in order to access a building component. In no event shall the amount of ACM so disturbed exceed that which can be contained in one glove bag or waste bag, which shall not exceed 60 inches in length and width.

This Program does not include all the necessary information to complete Class III Asbestos Work (as defined by OSHA in 29 CFR 1926.1101). Class III work requires detailed description of work practices and additional information regarding worker protection. All necessary additional information for completing Class III Asbestos Work can be obtained through the training programs that must be completed by Class III workers.

- **Class IV Asbestos Work:** Maintenance and custodial construction activities during which employees contact, but do not disturb, ACM or PACM. A "disturbance" of ACM/PACM refers to any activity that disrupts the matrix of ACM or PACM, crumbles or pulverizes ACM or PACM, or generates visible debris or dust from ACM or PACM. Class IV Asbestos Work also involves activities to clean up dust, waste and debris resulting from Class I, II, and III activities. However, Class I and II activities are categories for asbestos removal work that are performed by licensed abatement contractors; and therefore, go beyond the scope of an O&M Program.

¹ Presumed asbestos-containing material means thermal system insulation and surfacing material found in buildings constructed no later than 1980.

² According to the EPA, a miscellaneous ACM is a material that is not sprayed-on or troweled-on surfacing material, and is not used as thermal insulation. Miscellaneous materials could include floor tile and ceiling tile.

3. O&M Program Implementation Overview

This O&M Program is established with the intent of managing ACMs/PACMs as follows:

- Abate any existing asbestos hazards utilizing a licensed asbestos removal contractor.
- ACMs/PACMs in fair to good condition will be maintained in-place in their existing condition.
- Establish procedures to minimize and/or avoid ACM/PACM disturbance.
- Contract asbestos removal activities prior to any maintenance/repair, renovation, or other activities that may cause an asbestos disturbance. [In-house asbestos abatement capabilities can be established. However, this is not within the scope of this O&M Program report. Guidance for in-house asbestos work can be obtained upon O&M worker training or can be provided by Bureau Veritas as a supplement to this O&M report.]

Listed below is a checklist of the programs and/or procedures that should be implemented as part of this O&M Program. These programs/procedures include immediate and on-going activities for proper management of ACMs and PACMs at the Project. Upon implementation of the O&M Program, the APM should be able to check off each of the activities listed within the **O&M Implementation Checklist**. Within the **O&M Implementation Checklist**, references are made to report section(s) that provide further description.

3.1. O&M Implementation Checklist

The APM should check that each of the activities/programs listed below has been completed or is implemented on an on-going basis.

- **APM Training – Minimum two day EPA Accredited O&M training (Section 7.1).**
- **Worker Training (Section 7.1).**
- **Visual Reinspection of Project by the APM after completion of O&M training (Section 7.2).**
- **Initial Clean-Up, Abatement, and/or Testing of known or potential friable asbestos hazards (Section 7.3).**
- **Maintenance and Custodial Personnel (if applicable) – Awareness Training (2-Hour).**
- **Maintenance Personnel (if applicable) – O&M Worker Training (2-day), if workers conduct work that could potentially disturb ACM in quantities less than three square feet or three linear feet.**
- **Employee, Tenant (if applicable), and Contractor Notifications (Section 7.4).**
- **Asbestos Labeling (Section 7.5), if necessary.**
- **Signage (Section 7.6), if necessary.**
- **Periodic Surveillance procedures (Section 7.7).**
- **Record Keeping procedures (Section 7.8).**
- **Work Control/Permit System (Section 9.0).**

3.2. Statement of Intent

It is Management’s policy that deteriorated asbestos can be prevented at the Nelson Park Apartments by diligent upkeep of the structure. As part of this commitment, Management will use this Asbestos O&M Plan as a guidance document to help maintain the Property in good repair.

Signed: _____ Date: _____

Printed Name: _____

3.3. Annual Review

It is the policy of Management to review this Asbestos O&M Plan on an annual basis (at a minimum) and ensure that the plan is being adhered to. This O&M Plan cannot be modified without prior approval from the Property Owner or their representative.

This O&M Plan was last reviewed by:

4. Responsibilities

4.1. Asbestos Program Manager

Designation: The position of Asbestos Program Manager (APM), as appointed by the Property Management, is to be held by:

Qualifications: The APM should be properly qualified, through training and experience. The APM should also be trained in aspects of asbestos handling appropriate for the nature of work, to include procedures for setting up glove bags and mini-enclosures, practices for reducing asbestos exposures, use of wet methods, the contents of applicable OSHA, EPA and state regulations, and the identification of asbestos. Completion of an EPA approved Operations and Maintenance course is required. Bureau Veritas recommends that the APM acquire EPA accreditation under the Asbestos Hazard Emergency Response Act (AHERA) or state certification as a Building Inspector/Management Planner and/or Abatement Supervisor.

Duties: Act as the Competent Person for all class IV asbestos work in the building. As such, the APM's duties include health and safety inspections of custodial operations where ACM may be encountered. These inspections should be made at intervals sufficient to assess whether conditions in the work area have changed, and at any reasonable time at employee request.

Perform regular visual inspections of the ACM/PACM, documenting material condition, assessing the material's hazard potential and scheduling appropriate response actions.

Ensure that workers are properly trained in proper asbestos O&M techniques. In addition, he or she will properly notify and oversee the custodial and maintenance staffs, tenants, contractors, and outside service vendors with regard to all asbestos-related activities.

The APM will only employ qualified and licensed asbestos abatement contractors (See also Section 4.4) for abatement projects, independent of the asbestos consultant and the licensed laboratory.

The APM will affirm that any contractors/consultants that are engaged follow appropriate worker protection including respiratory protection, protective clothing, and hygiene facilities, and utilize environmentally protective practices including designation of regulated areas, use of safe housekeeping procedures, and posting of necessary signage.

The APM will confirm that all appropriate regulatory agency notification and personnel notifications have been completed. More detailed understanding of appropriate contractor work practices can be obtained in the various sections of this O&M report, and will also be obtained upon APM training.

The APM will ensure proper disposal of all ACM waste generated and that the recordkeeping requirements of this Program are met and maintain the Program files.

The APM will notify those whose activities may disturb ACM/PACM.

4.2. Maintenance and Custodial Staff

Qualifications: All maintenance and custodial staff shall have annual asbestos awareness training at a minimum. A two-hour initial training course and two-hour annual refresher course will meet this requirement.

Duties: Conduct ACM surveillance on a continuous basis as part of regular duties. Any damaged ACM/PACM shall be reported to the APM immediately and documented in the Program files.

Assist the APM as necessary.

4.3. Asbestos Consultant

Designation: Bureau Veritas has developed the Program.

Duties: As part of an annual update (separately proposed), Bureau Veritas can review the success of Program implementation as part of a reinspection and update. As part of this update, Bureau Veritas will notify the Client of any changes in regulations that may affect the Program.

In general, an asbestos consultant can (1) design large abatement projects, (2) observe the work of abatement contractors, (3) inform applicable employees of the presence of ACM prior to the abatement work being performed, (4) conduct air monitoring before, during, and after abatement projects, as appropriate, and (5) prepare and submit final abatement project reports.

Preparation of a specification or detailed scope of work will be necessary for major asbestos abatement activities. The specification shall be site-specific and detailed for a particular project or operation. Specifications will be required for all major work by abatement contractors, except for routine operations conducted under the guidance of the designated environmental consultant.

4.4. Asbestos Removal Contractor

Duties: Any contractor hired to perform activities at the facility within or beyond the extent of the Program shall follow the standards and procedures of the Program as well as applicable laws and regulations.

Asbestos Abatement Contractors should be fully licensed and are responsible for all asbestos clean up, repair and abatement in accordance with all federal, state and local regulations. Abatement and disposal of ACM will be conducted in accordance with applicable laws and regulations and within generally accepted standards of the asbestos abatement industry.

5. Asbestos Regulations

The asbestos regulations listed in this section shall be considered part of this Program. In the case of conflict between federal and state regulations, the more stringent regulations apply.

5.1. Occupational Safety and Health Administration

29 CFR 1910.1001	Occupational Exposure to Asbestos; General Industry
29 CFR 1926.1101	Occupational Exposure to Asbestos; Construction Industry
29 CFR 1910.134	Use of Respirators

5.2. Environmental Protection Agency

40 CFR 61, Subpart M	National Emission Standard for Hazardous Air Pollutants (NESHAP); Asbestos Regulations
40 CFR 763, Appendix C to Subpart E	Asbestos School Hazard Abatement Reauthorization Act (ASHARA)/ Asbestos Model Accreditation Plan

5.3. State of Ohio Asbestos Regulations

Ohio Revised Code (ORC)	
Ohio Administrative Code (OAC)	
OAC 3701 – 34 – 06	Asbestos Hazard Evaluation Specialist application content, qualifications, and standards of conduct.
OAC 3745 – 20	Asbestos Emission control
ORC § 3710	Asbestos abatement - licensing and accreditation standards
1 ORC § 153.15	Evaluation of asbestos hazard and appropriate response.
23 ORC § 2305.09	Limitation for School District Action Concerning Asbestos.
ORC §5301.30	Requires every person who intends to transfer any residential property by sale, land installment contract, lease with option to purchase, exchange, or lease for a term of 99 years and renewable forever, to complete and provide a copy to the prospective transferee of the applicable property disclosure forms.

6. Asbestos-Containing Materials at Nelson Park Apartments

The list of ACMs is based on information contained in the following report:

- Baseline Asbestos Survey prepared by Bureau Veritas (Bureau Veritas Project No. 156846.22R000-001.086). According to the Survey: Bureau Veritas collected and analyzed one thousand five hundred six (1,506) bulk samples with laboratory analysis of bulk samples showing asbestos to be present (>1% by weight) in one hundred seventy-two (172) samples. <1% Asbestos was detected in eight (8) materials.

The following were identified as friable asbestos-containing materials identified on the property:

- Paper wrap on duct
- Drywall tape and compound
- Vibration Joint
- Paper tape on duct
- Rough texture on drywall
- Drywall composite
- Exterior caulk

The following were identified as non-friable asbestos-containing materials identified on the property:

- Cove Base

The following were identified to contain less than one percent asbestos:

- Drywall composite
- Rough texture on drywall

The remaining materials were found to have no asbestos detected by laboratory analysis via PLM.

The above-listed results are not a comprehensive asbestos survey and should not be relied upon as such.

Additional ACMs and/or presumed ACMs may be located at the Project in areas not accessed by the inspector or because of limited sampling and analysis conducted as part of the screening. Therefore, additional inspection is recommended of any areas that may undergo renovation or demolition. Furthermore, initial or additional sampling may be necessary prior to disturbance of specific suspect/presumed ACMs.

Asbestos-containing materials have been presumed (PACM), or have been identified (ACM) at the Project by laboratory analysis of bulk samples. If ACM has been identified, the documentation should be utilized as part of this O&M Plan.

The basis for "assumed" determination is taken from the materials listed in Appendix G of the United States Environmental Protection Agency (USEPA) publication *Managing Asbestos in Place* (the "Green Book"), and from the OSHA Asbestos in Construction Standard (29 CFR 1926.1101). Therefore, all materials listed in the Green Book that were installed prior to 1989 are considered suspect with the exception of resilient flooring and associated mastics, asbestos-cement board (Transite), and some roofing materials. These materials are considered suspect regardless of installation date because they have not been banned by the USEPA.

Prior to conducting any maintenance work which may disturb any suspect ACMs (including, but not necessarily limited to those listed in the following three report subsections), the APM should determine whether any known or suspect ACM(s) will be potentially disturbed. The APM should review O&M Program records to determine whether all materials that may be disturbed have been adequately sampled and analyzed for asbestos content. If suspect ACM(s) will be potentially disturbed, the APM should arrange for sampling and analyses of the suspect ACM(s) prior to commencement of work. In lieu of sampling and analyses, suspect ACMs can be assumed to be and treated as asbestos-containing.

Determining whether any suspect ACMs will be disturbed by maintenance work, renovation, or demolition may be accomplished through review of previous inspection and sampling records (if available). However, if insufficient data is available, inspection and possibly sampling must be conducted by a properly trained and/or licensed APM, properly trained/licensed O&M personnel, or a properly certified and/or licensed asbestos consultant.

Sampling and analysis of suspect ACM materials should be done prior to repairs, renovation, or demolition activities that may cause a disturbance. Until sampled, these materials should be maintained in-place in good condition as part of the Operations and Maintenance Program. If these materials are damaged, they should be treated as friable materials.

Any identified asbestos-containing materials (in quantities greater than three square or linear feet) that are damaged should be repaired or removed by a licensed asbestos contractor in accordance with all applicable federal, state, and local regulations. Repair or removal should be supervised by an independent, third party industrial hygiene firm.

Generally, other types of ACMs/PACMs at the Project may include, but are not necessarily limited to the following:

- Vinyl flooring materials and associated mastics
- Roofing materials
- Wallboard – joint compound
- Spackling compounds
- Other mastics (i.e. carpet or ceiling tile)
- Caulking / Putties
- Cement Wallboard
- Sprayed-on or troweled –on acoustical
- Textured paints / coating
- Stucco

- Cement Siding
- Fireproofing
- Fire doors
- Fire blankets
- Fire curtains
- Chalkboards
- Vinyl Wall Coverings
- Ceiling tiles and Lay-in panels
- Decorative plaster
- Blown-in insulation
- Pipe insulation
- Pipe fitting insulation
- Duct or flue insulation
- Insulation seam sealants
- Heating and electrical ducts
- Flexible duct work connectors,
- Duct work taping cloth,
- Duct work mastic
- Boiler or tank insulation or insulation
- Electrical cloth
- Electrical panel partitions
- High temperature gaskets
- Cooling tower panels or other cement (Transite) panels/materials
- Elevator brake shoes and equipment panels
- Window glazing.

It is Bureau Veritas's opinion that Resilient Flooring materials, Mastics, asphalt roofing products, joint compound, and Transite materials installed at any time, as well as the remaining listed materials installed prior to 1989 should be considered suspect ACMs. Therefore, any such material applications located at the Project should be assumed to contain asbestos, (unless sampled and proven otherwise) and should be maintained in good condition, in accordance with this O&M Program.

Sampling and analysis of suspect/presumed ACM materials should be done prior to repairs, renovation, or demolition activities that may cause a disturbance.

7. O&M Program Implementation

7.1. Worker Training

The Owner shall, at no cost to the employees, institute a training program for the following employees:

- Employees who perform repair and maintenance operations where ACM/PACM is likely to be disturbed (Class III asbestos work).
- Employees who perform maintenance, custodial, or housekeeping activities during which employees contact, but do not disturb, ACM or PACM and activities to clean up dust, waste, and debris resulting from Class I, II, and III activities (Class IV asbestos work).

Training shall be provided prior to or at the time of initial assignment, and at least annually thereafter (for Class III work).

Any maintenance staff that may be expected to perform Class III and IV work shall receive training equivalent to the 16-hour Operations and Maintenance course developed by EPA for maintenance and custodial workers who conduct activities that will result in the disturbance of ACM/PACM. (Work Practices, worker protection and other guidelines necessary for completion of Class III work are not contained within this O&M Program and must be obtained upon training.) The training course shall include "hands-on" training in the use of respiratory protection and work practices. A 16-hour training course is required under most circumstances to meet this requirement. If duties are limited to activities such as changing of gaskets, a course of lesser duration may be sufficient. An annual refresher course of four hours is also required.

Although only a 16-hour course is required for employees conducting Class III, Bureau Veritas recommends that the acquisition of EPA accreditation under the Asbestos Hazard Emergency Response Act (AHERA) or state certification as an Asbestos Worker.

Training for maintenance, custodial, or housekeeping staff (performing Class IV work) shall consist of training equivalent in curriculum and training method to the awareness training course developed by EPA for maintenance and custodial workers who work in buildings containing ACM. The course shall include available information concerning the locations of ACM and instruction in recognition of damage, deterioration, and delamination of ACM. A two-hour initial training course and two-hour annual refresher course will meet this requirement.

OSHA asbestos regulations require that the Employer inform all employees of the availability of self-help smoking cessation program material. Upon employee request, the employer shall distribute such material, consisting of NIH Publication No. 89-1647, or equivalent self-help material, which is approved or published by a public health organization.

7.2. Visual Reinspection

A visual reinspection of the Project should be conducted by the APM or by properly trained O&M personnel immediately upon completion of APM training. One purpose of the reinspection is to identify all ACM, PACM, or hazardous conditions that may have been overlooked upon previous inspection (Oversights may have occurred due to lack of training or understanding). The reinspection should be conducted utilizing the **ACM Inspection Form** that is included in Appendix D.

Another purpose of the reinspection is to determine the need for **Notifications, Labeling, and Signage**. Based on the locations and conditions of ACMs and PACMs present at the Project, these activities may be recommended or required (see Sections 7.4, 7.5, and 7.6).

All records of inspection, notifications, etc. should be maintained within the permanent O&M Program files.

7.3. Initial Clean-Up/Abatement/Testing

The APM shall immediately address any damaged ACM/PACM conditions identified during any initial inspections or reinspections. Actions taken by the APM may be self-directed or based on consultation with Bureau Veritas or other consulting personnel. Appropriate response actions may be as simple as restricting access to affected areas of the Project to properly trained and/or protected personnel. Response actions may also include abatement (repair, removal, enclosure, etc.) of damaged material or hazardous conditions. Sampling of damaged materials may also be necessary prior to determination of appropriate response actions.

Damaged ACM/PACM conditions or any other evidence of an asbestos fiber release will be recorded on an Asbestos Fiber Release Episode Report Form (Appendix G). The form will be completed upon remediation of the condition.

All records of sampling, analysis, and abatement actions should be maintained within the permanent O&M Program files.

7.4. Notification

Building Personnel Notification

It is important to undertake an honest and open approach to the Asbestos notification procedure. People who are informed of the presence, location and condition of ACM/PACM in a building where they work, who understand that the mere presence of Asbestos is not necessarily hazardous to them, and who accept that Asbestos can often be managed effectively in place, can be very helpful to the owner or APM in eliminating or reducing hysteria on the part of other less informed building occupants.

This section is intended to comply with the Hazard Communication requirements of the OSHA Asbestos in Construction Standard (29 CFR 1926.1101(k)). Persons who use, occupy, or are affected by an area where ACM work will occur should be notified prior to the start of the work. OSHA regulations include mandatory notification of certain personnel prior to the performance of work regulated by OSHA. The APM shall notify the following persons of the presence, location and quantity of ACM at the work sites in their building and facilities:

- Prospective employers applying or bidding for work whose employees reasonably can be expected to work in or adjacent to areas containing ACM/PACM.
- Employees of the owner who will work in or adjacent to areas containing ACM/PACM (Maintenance and Custodial personnel).
- On multi-employer worksites, all employers of employees who will be performing work within or adjacent to areas containing ACM/PACM.
- Employers of employees (commercial tenants) who will occupy areas containing ACM/PACM.

Notification either shall be in writing, or shall consist of a personal communication between the APM and the person to whom notification must be given or their authorized representative. In either case, record of the notification shall be included in the O&M Program files.

Regardless of the format, the following information should be included with the notifications (also see the Example Notification Letter in Appendix E):

- ACM/PACM has been identified in the building and is located in areas where the material could be disturbed.
- The location and condition of the ACM/PACM, and the response that is appropriate for that condition.
- Asbestos only presents a health hazard when fibers become airborne and are inhaled. The mere presence of Asbestos within a building does not represent a health hazard.
- Do not disturb the ACM/PACM.
- Report any evidence of disturbance or damage of ACM/PACM to the APM.
- Report any dust or debris that might come from the ACM or PACM, any change in the condition of the ACM/PACM, or any improper action (relative to ACM/PACM) of building personnel to the APM.
- Cleaning and maintenance personnel are taking special precautions during their work to properly clean up any asbestos debris and to guard against disturbing ACM/PACM.
- All ACM/PACM is inspected periodically and additional measures will be taken if needed to protect the health of building occupants.

Personnel should be given information about

- The specific work to be performed,
- The work schedule, precautions being taken,
- What will be visible during the work, and
- Posted warning sign

Section 4 of the EPA Green Book includes information on occupant, tenant and worker notification of the presence of ACM that might be helpful to the APM.

If O&M work occurs frequently, and notification is needed, a general notice to affected personnel might be more convenient than notifying these personnel each time work occurs.

Federal, State and Local Notifications

The APM, his designee, or abatement contractor should file all notices required by federal, state and local regulations prior to the start of any O&M activities that are governed by these regulations.

Federal Notifications

Federal requirements for notification are set forth in the National Emission Standards for Hazardous Air Pollutants (NESHAP) rules and the EPA Worker Protection Rule. For demolition and renovation work, the latest NESHAP revisions are contained in 40 CFR 61.145 (a) and (b). A ten working day federal notification is required for renovation work if the combined amounts of regulated ACM (RACM - see glossary or NESHAP for definition) to be stripped, removed, dislodged, cut, drilled or similarly disturbed is over 260 linear feet (80 linear meters), 160 square feet (15 square meters) or 35 cubic feet (1 cubic meter) for any single project. EPA's NESHAP rules specifically warn that "single projects" cannot be subdivided into smaller projects in an attempt to avoid notification requirements.

Also, if the combined estimated quantities of RACM to be removed or stripped in individual non-scheduled operations during a calendar year (January 1 through December 31) exceeds the amounts listed above, a NESHAP notice must be submitted at least ten working days before the end of the calendar year (e.g. December 15) preceding the year for which notice is being given. A new written notice must be filed with the EPA if the start date for a project is revised (earlier or later) from the date filed in the original or a previous notice. A notice must be updated if the amount of asbestos affected changes by 20 percent or more.

If wetting of RACM during removal would unavoidably damage equipment or present a safety hazard, written approval from the EPA is required for alternative emission control methods (dry removal).

The NESHAP notification requirements for emergency renovation work are set forth in 40 CFR 61.145 (a) and (b). See NESHAP regulations for details on Federal notification requirements. Additional requirements might also be included in state or local regulations.

State and Local Notification Requirements

State and local notification requirements vary greatly. Many states and localities have notification requirements that are more stringent than the federal requirements. State and local requirements concerning permits for any repair or renovation work must be reviewed. State and local requirements must be complied with before work is scheduled and commenced.

7.5. Labeling

In order to inform Maintenance, Custodial, and other personnel of potential asbestos hazards, asbestos labeling and/or signage may be necessary at the Project. If easily damaged ACMs or PACMs are present in maintenance areas of the Project, labels should be affixed directly to the ACMs/PACMs or warning signs should be posted (as discussed in the following section). Easily damaged ACMs/PACMs include thermal system insulation (TSI) materials, surfacing material, or any other friable materials (also see Section 5 for a list of identified friable ACMs/PACMs).

If ACM/PACM labeling is conducted, then labels shall be affixed to all friable ACMs/PACMs within each mechanical or other building area that is not accessible to the public, but is accessible to maintenance, custodial, or contracted personnel.

Labels must also be affixed to all containers containing such products, including waste containers, regardless of signage.

Labels shall be printed in large, bold letters on a contrasting background.

Labels shall bear the following information:

**DANGER
CONTAINS ASBESTOS FIBERS
AVOID CREATING DUST
CANCER AND LUNG DISEASE HAZARD**

7.6. Signage

If signage is conducted at the Project in addition to or in-place of labeling, then warning signs should be posted at the entrance to mechanical rooms/areas in which employees reasonably can be expected to enter and which contain thermal system insulation material, surfacing ACM, or other friable ACM(s) (also see Section 6). This includes each mechanical or other building area that is not accessible to the public, but is accessible to maintenance, custodial, or contracted personnel. The APM shall post signs that identify the ACMs/PACMs which is/are present, its/their location, and appropriate work practices which, if followed, will ensure that ACM/PACM will not be disturbed.

No example of a mechanical room/area sign is provided since they can vary greatly, depending on the types of ACMs present.

The APM should also ensure that warning signs are posted by any asbestos removal contractors conducting work within their building(s). Warning signs that demarcate the regulated area during a response action shall be provided and displayed at each location where a regulated area is established. Signs shall be posted at such a distance from the regulated area that an employee may read the signs and take necessary protective steps before entering the area marked by the signs. These warning signs shall bear the following information:

**DANGER:
ASBESTOS
CANCER AND LUNG DISEASE HAZARD
AUTHORIZED PERSONNEL ONLY
RESPIRATORS AND PROTECTION
CLOTHING ARE REQUIRED IN THIS AREA**

7.7. Periodic Surveillance

Reinspection of all ACM/PACM in common and employee accessible areas should be conducted by the APM upon implementation of this Program (as discussed in Section 7.2) and at least every six months thereafter. In addition, Maintenance and Custodial Workers should be trained to conduct Asbestos surveillance on a periodic basis as part of their regular duties at the facility. Maintenance and custodial staff can conduct an Asbestos surveillance within common areas, employee areas, as well as other areas while conducting their regular job duties. Any damaged ACM/PACM identified by Maintenance and Custodial personnel shall be brought to the immediate attention of the APM.

Damaged ACM/PACM conditions or any other evidence of a asbestos fiber release will be recorded on an Asbestos Fiber Release Episode Report Form (Appendix G). The form will be completed upon remediation of the condition.

Every six months a member of the building staff or management should survey known ACM/PACM sites in the building and prepare a report indicating change in condition. The **ACM Inspection Form** in Appendix D can be utilized for the Periodic Surveillance.

During the semi-annual periodic surveillance, the APM or designee will personally observe the condition of all ACM/PACM at the facility and schedule the appropriate response action when necessary. If damaged ACM/PACM is identified, the APM will determine if the material can be effectively maintained in the Operations and Maintenance Program, or if based on the risk of asbestos fiber release, removal, repair, encapsulation or enclosure is warranted. In the event that new damage is noted, a licensed contractor should be engaged to correct the condition. The APM shall schedule repair of damaged material when necessary.

Any removal of ACM/PACM where the primary purpose is removal, as opposed to the cutting away of small amounts of ACM/PACM in order to access a building component, shall be considered asbestos abatement. Asbestos abatement (removal, repair, encapsulation and/or enclosure) at the facility shall be accomplished by a licensed asbestos contractor. In addition, any disturbance of ACM greater than that which can be contained in one standard sized glovebag or waste bag (which does not exceed 60 inches in length and width) shall be performed by a licensed asbestos contractor.

If the reinspection discovers no change in ACM/PACM conditions and all materials are in good condition, then this too should be included in the report. This report should then become part of the building's permanent O&M Program file, which must be kept for a minimum of 30 years.

It would be prudent for the APM to have the Project reinspected every three years by a licensed asbestos inspector³. The inspector will prepare a report on the ACM/PACM conditions and recommended response actions (if any). If remedial action is needed, then a licensed asbestos abatement contractor should be engaged to make the area(s) safe.

The APM should also consider having the Project inspected by a licensed asbestos inspector whenever building demolition, alteration, renovation, or modification work is planned, or for any work at the Project that will potentially disturb ACM or PACM.

The APM should consider contacting the asbestos consultant prior to initiating asbestos abatement work. Depending on the scope of work, detailed project specifications may be necessary to ensure satisfactory project completion. In addition, the latest EPA Asbestos Model Accreditation Plan requires that an EPA accredited Project Designer design any abatement activities that are beyond the scope of an O&M Plan.

7.8. Record Keeping

Record Keeping Required By This Program

All documentation required by this O&M Program shall be stored in permanent files for the life of the facility and must be transferred to successive owners of the facility. Records shall be maintained for all activities involving ACM/PACM and shall include: those records listed below, contractor and other personnel notifications and reports, and all other documentation of Program compliance.

The following records (as applicable) of O&M work should be retained in permanent files:

- ACM Inspection Forms (Appendix D), any reinspection reports, assessment reports, or sampling data
- A copy of the O&M Program (initial Program and all updated versions)
- The Work Practices Used
- Respiratory Protection Program
- Fiber Release Reports
- Job Request Forms for Maintenance Work (Appendix A)
- Maintenance Work Authorization Forms (Appendix B)
- Periodic Surveillance Reports
- Waste Tracking and Disposal (Appendix C)
- Air Monitoring Data
- Qualifications and Performance Records for Outside Contractors performing O&M work
- Verification of Employee Training (Appendix F)
- Data to rebut presumption that materials are asbestos-containing. For employers with employees engaged in asbestos-related work⁴, federal regulations require that the employer retain:
 - Personal Air Sampling/Exposure Monitoring Records
 - Historical Data (used to qualify for exemptions from OSHA's initial monitoring requirements)
 - Medical Records (for employees subject to a medical surveillance program)
 - Employee Training Records
 - Fit Test Records (for employees that use respirators)
 - Data to rebut presumption that materials are asbestos-containing.

³This triennial inspection originally started with a EPA regulation pertaining to schools, but is now considered good practice for any facility.

⁴ This applies to Class III work, as well as to Class I and Class II work.

Under the Records Access Standard (29 CFR 1910.20), the Hazard Communication Standard (29 CFR 1910.1200 & 1926.59), and the asbestos in construction standard (29 CFR 1926.1101(n)), OSHA requires that employers provide to each employee his or her record of exposure and medical surveillance (if applicable). If necessary, refer to the OSHA Asbestos in Construction Rule (29 CFR 1926.1101), the EPA Worker Protection Rule (40 CFR 763 Subpart G) and/or the Green Book for details on Record keeping requirements. Note that state and local regulations may require that additional information be recorded and retained.

EPA recommends that building owners make available all written elements of the O&M Program to the building's O&M staff, as well as to tenants and building occupants, if applicable. Building owners are also encouraged to consult with their legal counsel concerning appropriate record keeping strategies as a standard part of their O&M programs.

Training Records

In accordance with the OSHA Asbestos in Construction Standard, the employer must maintain training records for one year beyond the last date of employment for each affected employee.

Inspection, Hazard Assessment And Abatement Records

Asbestos inspections, hazard assessments, abatement records and any other information concerning the identification, location and quantity of ACM/PACM shall be maintained by the APM for the life of the facility, and must be transferred to successive owners of the facility.

Objective Data

In accordance with the OSHA Asbestos in Construction Standard, objective data relied upon as part of an *Initial Exposure Assessment* or a *Negative Exposure Assessment* (See Appendix I, Glossary) must contain the following listed information. Note: an initial or negative exposure assessment should not be necessary unless Class I, II, or III⁵ Asbestos Work is performed.

- The product qualifying for exemption;
- The source of the objective data;
- The testing protocol, results of testing, and/or analysis of the material for the release of asbestos;
- A description of the operation exempted and how the data support the exemption;
- Other data relevant to the operations, materials, processing, or employee exposures covered by the exemption.

Objective data records shall be maintained for the duration of the employer's reliance upon such objective data.

Exposure Assessment Records

Exposure assessment records must include the following information. Note: an exposure assessment should not be necessary unless Class I, II, or III Asbestos Work is performed.

- The date of measurement;
- The operation involving exposure to asbestos that is being monitored;
- Sampling and analytical methods used and evidence of their accuracy;
- Number, duration, and results of samples taken;
- Type of protective devices worn, if any;
- Name, social security number, and exposure of the employees whose exposures are represented.

Exposure assessment records shall be maintained for at least 30 years past the end of employment.

Medical Surveillance Records

Medical surveillance records must include the following listed information. Note: Medical Surveillance of employees should not be necessary unless Class I, II, or III Asbestos Work is performed (see reference to footnote (4) on previous page for explanation).

- The name and social security number of the employee;
- A copy of the employee's medical examination results, including the medical history, questionnaire responses, results of any tests, and physician's recommendations;
- Physician's written opinions;
- Any employee medical complaints related to the exposure to asbestos;
- A copy of the information provided to the physician;

Medical surveillance records must be maintained for the duration of employment plus 30 years.

Transfer of Records

In accordance with the OSHA Asbestos in Construction Standard, if the employer ceases to do business and there is no successor employer to receive and retain records for the prescribed period, the employer shall notify the Department of Labor (DOL) at least 90 days prior to disposal and, upon request, transmit the records to the DOL.

⁵ Class III work has been previously defined in this document. Class I and Class II work is removal of ACM or PACM that is usually performed by accredited abatement contractors.

8. O&M Work Practices

8.1. Emergency Response Procedures

As long as ACM remains in the Project, a fiber release episode could occur if the ACM/PACM is inadvertently disturbed. Building staff will immediately report to the APM the presence of suspect asbestos-containing debris on the floor, water or physical damage to the ACM/PACM, or any other evidence of a fiber release. At the same time, an Asbestos Fiber Release Episode Report Form (Appendix G) will be initiated; and subsequently completed upon remediation of the condition.

The APM will conduct the following procedures:

- Evaluate the extent of ACM/PACM damage;
- Barricade contaminated areas against entry by unauthorized personnel;
- Isolate the contaminated area by sealing doors and vents with polyethylene sheeting and duct tape (or equivalent),
- Shut off or isolate the affected air handling system to prevent asbestos migration
- Post a warning sign outside the contaminated area; and
- Contact an Asbestos Consultant.

If extensive damage or delamination of ACM/PACM has occurred (e.g., greater than three square feet or three linear feet) consider total removal of the ACM by a pre-approved abatement contractor in the affected area(s), followed by replacement with a non-asbestos-containing material⁶.

8.2. Areas With Friable ACM

Friable ACM (for example, sprayed-on fireproofing on the structural element of the Project; and thermal system insulation [TSI] on the pipes, elbows, and/or boiler, and other vessels) will not be disturbed in quantities greater than three square feet or three linear feet by anyone other than the approved licensed abatement contractors. If any material dislodges because of the accidental disturbance or water leak, an Asbestos Consultant will be contacted as soon as possible after the area is secured. The Asbestos Consultant will contact an approved abatement contractor to respond to the emergency.

8.3. Areas With Non-Friable ACM

Non-friable ACM (for example, floor tile, mastic, and cementitious asbestos panels [e.g., Transite]) typically release fibers only when damaged or disturbed. Fiber releases can occur when workers drill, cut, abrade, break, or saw vinyl asbestos floor tile or any other non-friable material. General cleaning and maintenance, however, will not damage the material. USEPA has instituted recommended guidelines that should be followed by the building staff when stripping wax or finish coat from asbestos-containing flooring (see section 8.5).

8.4. Common Maintenance Activities Impacting ACM

Some examples of maintenance activities performed in specific locations, which may impact suspect or confirmed ACM are listed below. This work must be performed by taking the proper care and precautions, so as to not disturb the ACM.

Examples of Maintenance Activities Which May Potentially Impact ACM/PACM

- Maintaining Thermal Pipeline System
- Repairing Leaking Pipe Fittings
- Removal of Overlay Carpeting; Buffing
- Sanding or Grinding Floor Tiles
- Duct Riser Repair or Maintenance
- Accessing Columns or Walls, Repairing Light Fixtures
- Access to Above Suspended Ceilings
- Changing Fluorescent Light Bulbs

As required by applicable Federal, State and/or local laws and regulations, the APM will inform employees about the location and physical condition of ACM/PACM that may be disturbed. In addition, common safety practices have been included in Appendix H at the end of this document.

⁶ It would be prudent of the APM to have representative samples of the new material tested for asbestos content prior to installation (refer to section 6 of this document for a list of PACMs).

8.5. Guidelines for Removing a Finish from Asbestos-containing Flooring

1. PROPERLY TRAIN STAFF. Custodial or building staff who strip floors will be trained to operate the machines and pads and use floor care chemicals properly and safely
2. AVOID STRIPPING FLOORS. Stripping of floors will be done as infrequently as possible, perhaps once or twice a year or less, depending on circumstances. The frequency will be carefully considered when floor maintenance schedules or contracts are written or renewed.
3. FOLLOW APPROPRIATE WORK PRACTICES. Custodial or building staff who strip floors will follow appropriate work practices, such as those recommended here, under informed supervision. Directions from floor tile and floor wax product manufacturers on proper maintenance procedures will be consulted.
4. STRIP FLOORS WHILE WET. The floor will be kept adequately wet during the stripping operations. DO NOT perform dry stripping. Prior to machine operation, an emulsion of chemical stripper in water is commonly applied to the floor with a mop to soften the wax or finish coat. Stop stripping when the old surface coat is removed. Over-stripping can damage the floor and may cause the release of asbestos fibers. DO NOT operate a floor machine with an abrasive pad on unwaxed or unfinished floors. After stripping and before application of the new wax, the floor will be thoroughly cleaned while wet.
5. RUN MACHINE AT SLOW SPEED. If the machine used to remove the wax or finish coat has variable speeds, it will be run at slow speed (about 175-190 rpm) during the stripping operations.
6. SELECT THE LEAST ABRASIVE PAD POSSIBLE. USEPA recommends that the machine be equipped with the least abrasive pad possible to strip wax or finish coat from asbestos-containing floors.

NOTE: Improperly removing asbestos-containing floor coverings could result in the release of high levels of asbestos fibers. USEPA *recommends* that you leave asbestos-containing floor covering in place, provided the material is in good condition. However, proper maintenance procedures, such as those previously outlined, should always be followed.

8.6. Cleaning

Cleaning up within specific areas of the Project is one of the primary objectives of the O&M Program. The APM shall retain a licensed asbestos abatement contractor to conduct initial cleaning in areas of the Project where damaged ACM/PACM are present as soon as the O&M Program is in place and before the initiation of any response action.

All cleaning activities are to be recorded and included in the O&M manual.

The licensed asbestos abatement contractor will also conduct subsequent minor repair and routine maintenance.

Initial Cleaning

When damaged ACM/PACM is present, the asbestos abatement contractor must HEPA vacuum and, if possible, wet clean all areas in the immediate vicinity. This includes cleaning all surfaces, such as shelves, walls, light fixtures, equipment housing, and exterior of ducts, with damp cloths or a HEPA vacuum.

All mop heads, damp cloths, liquid wastes, debris, filters, or vacuum bags must be disposed as asbestos-contaminated waste.

Periodic Cleaning

The determination of when/where periodic cleaning is needed is based on the rate of dust buildup. This determination will be made as part of the periodic inspection. If cleaning is necessary, a pre-qualified licensed asbestos abatement contractor will clean the areas.

The abatement contractor shall remove any debris found near damaged ACM using a HEPA vacuum or wet methods. The contractor shall HEPA vacuum and/or steam clean all carpets in rooms with damaged ACM and wet wipe all surfaces in the area. If steam cleaning is used, the liquid waste generated during the process must be disposed as asbestos-contaminated waste. The contractor must dispose of debris, filters, and/or vacuum bags as asbestos-contaminated waste.

8.7. Work Practices For Maintenance Activities

Before conducting any maintenance or repair work that will damage or disturb ACM, the APM shall inspect the area to update and determine appropriate action(s). Whenever the potential for release of asbestos fibers from ACM exists (for example, sanding floor tile, repairing a pipe leak, or installing conduit above a suspended ceiling), an outside asbestos abatement contractor, will perform the work procedures in the aforementioned sections.

Basic O&M procedures to minimize and/or contain asbestos fibers may include wet methods, use of mini-enclosures, use of portable power tools equipped with special local ventilation attachments, and avoidance of certain activities, such as sawing, sanding, and drilling ACM.

NOTE: During O&M procedures, personal air monitoring should be performed. In addition, all asbestos waste (generated during these activities) must be handled in accordance with all local, state, and federal requirements.

Maintenance activities can be divided into three categories with regard to their potential for disturbing ACM:

Contact with ACM Unlikely - In-House Personnel

Maintenance activities or repairs that can be performed without contacting or disturbing the ACM/PACM require little more than normal care and good workmanship and can be performed by in-house personnel. These include, but are not limited to:

- Repairing non-ACM insulated pipes or valves without disturbing other ACM/PACM.
- Routine cleaning activities

All surfaces will be isolated to remove any settled fibers in the event that ACM/PACM are disturbed. If more than three square feet or three linear feet are disturbed, then a licensed abatement contractor should be called.

Contact with ACM Not Likely But Possible

Maintenance activities or repairs that may have the potential to cause accidental disturbance of ACM/PACM require some precautions. This work may be performed by trained maintenance staff only, since it requires information and guidance (for example, additional training and worker protection procedures) beyond the scope of this O&M Program. For this work to be completed, proper precautions must also be instituted to minimize the potential ACM disturbance. For example, special cleaning, possibly area isolation and respiratory protection, may be needed if the chance of disturbance is likely. Activities that fall into this category include, but are not limited to:

- Working on a fixture near thermal system ACM;
- Working on a fixture above suspended ceilings where asbestos-containing sprayed-on fireproofing or troweled-on acoustical material is present;
- Installation of telecommunication or electrical conduits above suspended ceiling; and
- Repairing of a pipe that is not insulated with ACM but will disturb ACM on nearby pipes.

Contact with ACM Likely Or Intended

Maintenance activities or repairs that involve intentional manipulation or disturbance of ACM require special work practices when done on a large scale (greater than three square or linear feet). A licensed abatement contractor must remove ACM before in-house personnel can perform their duties. The asbestos contractor must use personal protective equipment, including respirators and Tyvek suits. In addition, personal air monitoring, and other procedures must be followed when ACM is disturbed under these conditions.

Typical activities include but are not limited to:

- Removing a thermal system insulation to repair a pipe leak or replace a valve; and
- Removal of surfacing ACM to install new conduits or pipe braces.

Prior to performing any maintenance activities that will disturb ACM, the APM shall contact an Asbestos Consultant to provide area air monitoring before, during, and after the ACM disturbance, if necessary.

NOTE: **Under no circumstances will any in-house employee perform this type of abatement work, unless s/he has successfully completed an EPA-approved asbestos worker course, and an asbestos supervisor is present during the project.**

8.8. Special Work Practices For Planned Renovation Work

Future renovations may involve disturbing ACM or PACM and may also uncover building materials that were previously hidden and may contain asbestos. Work, such as moving walls, adding wings, and replacing heating or air-conditioning systems may involve breaking, cutting, or otherwise disturbing ACM.

All parties must be aware of potential ACM disturbance early in the project planning stage to determine appropriate actions. Partial or full removal may be necessary before renovation.

An independent Asbestos Consultant should develop guideline specifications or work plans in accordance with USEPA, OSHA, state, and local regulations, if necessary, for use by the asbestos abatement contractor.

An Asbestos Consultant shall ensure that the asbestos abatement contractor perform all work in compliance with applicable federal, state, and local laws and regulations. The Asbestos Consultant can assist in maintaining records of work, including copies of the specifications and closeout documentation.

9. Recommended O&M Work Control/Permit System

Introduction

The Work Control/Permit System described in this section is intended to assure communication between the APM, the maintenance staff, and outside contractors who may have been hired to work in the facility. This system is not designed to address all sizes and varieties of jobs that may cause potential asbestos disturbance. The forms and procedures utilized in this section and in this O&M Program may be more burdensome than is necessary for smaller jobs, depending on the types of ACMs or PACMs that are present at the Project.

Determination of which forms and Work Control/Permit System to use will be Project and situation dependant. Guidelines for which forms and procedures to use for typical or emergency work requests should be made by the APM at each Project. Subsequently, these guidelines should be outlined in interoffice correspondence or personnel training documents. Hence, the APM can develop Project specific guidelines for the types of activities that require completion of O&M forms, and guidelines for which forms to use for different materials and situations. Therefore, the guidelines for O&M Program procedures at each Project can be made by the APM, or through consultation with the Asbestos Consultant.

Work Control/Permit System

The APM or a designee should review O&M general procedures with all workers who will perform activities in the presence of ACMs. Workers should be notified to consult with the APM or the APM's designee if they have any questions, if any problems occur, if ACM/PACM disturbance may occur, or if it appears to the workers that additional precautions might be necessary to safely perform their duties.

This section describes one suggested method of O&M work tracking and record keeping procedures utilizing the attached and appended checklists, figures, and forms. A checklist (Figure 1) that guides the APM through necessary decisions and use of the appended tracking forms is provided below. A flowchart illustrating the typical decision scenarios and use of the appended forms is shown in Figure 2. The process of controlling, tracking, and record keeping for O&M work in order to minimize improper ACM disturbance can be achieved using forms contained in this O&M Program. Use of the forms contained in this O&M Program is summarized below. The numbered discussions presented below correspond to the numbers presented on the Checklist and the Flowchart.

- (1) As part of maintenance and custodial personnel training, O&M personnel are informed of the locations and conditions of ACMs, suspect ACMs, and PACMs. Personnel are also informed of routine custodial activities that can be performed without pre-authorization from the APM. Personnel are trained to recognize ACMs, suspect ACMs, and PACMs and recognize conditions that require review by the APM prior to commencement of work. That is, the APM sets guidelines for all other building personnel regarding work that can be performed without initiating the O&M Work Control/Permit System (completion of a **Job Request Form** initiates the System). The APM also sets guidelines regarding the types of work or materials disturbance that require initiation of the System. Guidelines may be different for each Project, dependant on the variety of ACMs, suspect ACMs, and PACMs as well as conditions present at each Project. Guidelines are set by the APM for each Project.

A **Job Request Form** (Appendix A) should be completed prior to maintenance work or other O&M activities, as the necessity for form completion is determined by the APM and subsequently prescribed by the O&M Program. The **Job Request Form** should be initiated by maintenance or custodial personnel for work that could disturb ACM. If the required work has been performed in the past, it might not be necessary to complete an **APM Checklist** for each O&M activity. Past checklists can be reused for determination of procedures.

- (2) Before commencing renovation, remodeling, demolition, repairs, or maintenance activities that may disturb ACM, suspect ACM, or PACM, an inspection for the presence of ACM must transpire. This shall include but not be limited to inspection of this Project's O&M Program to identify previously surveyed areas. The APM should review building inspection information to determine whether or not all suspect materials in the work area have been previously sampled and analyzed for asbestos content. The APM may need to inspect the area in which work will occur to determine the building materials that may be disturbed during the requested work. The APM should initiate an **APM Checklist** (Figure 1) and evaluate the work to be performed based upon the information on a completed **Job Request Form**, available survey and assessment data, and data on past O&M activities (if available). When reviewing data and completing the **APM Checklist**, the following should be determined:
- Whether the job requested is actually an asbestos O&M activity.
 - The category(ies) of ACM that might be encountered during the work (friable or non-friable; surfacing ACM, Thermal System Insulation (TSI) ACM, and/or miscellaneous ACM).
 - Whether an ACM/PACM disturbance is likely to occur.

All of the above information should be recorded on a **Maintenance Work Authorization Form** (Appendix B). If the APM determines that no ACMs, suspect ACMs, or PACMs are likely to be disturbed during the work described on the **Job Request Form**, the various forms are completed and signed, and the requested job is allowed to proceed.

- (3) If the APM determines that ACMs, suspect ACMs, or PACMs will be potentially disturbed during the requested work, then work cannot proceed without further action. If all building materials that will be disturbed have been tested during previous investigations, and it is known which materials are asbestos-containing and which materials are non-asbestos-containing, than the work can proceed without further investigation and/or testing. However, the APM should engage a licensed asbestos abatement company to abate (remove, encapsulate, or enclose) the known ACM so that no ACM will be disturbed during the renovation work.

- (4) If upon inspection of the work area, a material or area is identified which may be disturbed and has not been represented by previous survey and sampling efforts, then all such suspect ACMs should either be sampled by a licensed asbestos inspector and analyzed in accordance with EPA regulations, or be assumed to contain asbestos and treated accordingly. The APM shall employ the services of an environmental consultant or lab when the need for inspection and sampling services arises. A licensed asbestos inspector should be engaged to inspect the work area and sample any suspect/presumed ACMs that could be disturbed by the work.
- (5) The asbestos inspector's findings and sample analytical results will dictate whether asbestos abatement must be conducted prior to the initiation of work. If the inspector's report concludes that all materials to be potentially disturbed are non-asbestos-containing, the work described on the **Job Request Form** can proceed without further investigation or asbestos abatement. The APM completes and signs the **Job Request Form, Maintenance Work Authorization Form, and APM Checklist**.
- (6) If the inspector's report concludes that any of the materials to be potentially disturbed during the work is/are asbestos-containing, then the APM should engage a licensed asbestos abatement company to abate (remove, encapsulate, or enclose) the known ACM such that no ACM will be disturbed during the work. The APM should ensure proper licensure of all contractors, verify that all regulatory agency notifications are completed, and notify any building personnel that may be in the area of or disrupted by the asbestos abatement activities.
- Depending on the scope of work, detailed project specifications may be necessary to ensure satisfactory project completion. In addition, the EPA Asbestos Model Accreditation Plan requires that an EPA accredited Project Designer design any abatement activities that are beyond the scope of an O&M Plan.
- The APM should separately contract licensed asbestos air monitoring personnel to conduct air sampling during the asbestos abatement activities. The air monitoring company and the asbestos abatement company should not be affiliated, so as to avoid any conflicts of interest. Air monitoring is necessary to demonstrate that the work area or any portion of the building was not contaminated by the asbestos abatement work.
- (7) The APM or a designee should review work practices with the workers/contractors who will perform the work. Workers/contractors should be notified to consult with the APM or designated person if they have any questions during the work, if any problems occur, or if it appears to the workers that additional precautions might be necessary to safely perform the work. Copies of all pertinent information should be provided to asbestos abatement contractors, including any asbestos investigation/survey reports or laboratory results, asbestos abatement specifications, regulatory agency notifications, etc. Also, copies of information as listed on the **APM Checklist** and **Maintenance Work Authorization Form** should be provided to the asbestos abatement workers who will perform the asbestos work.
- (8) The APM or a designee should review the activities of asbestos abatement and air monitoring contractors during their work in order to protect the interests of the building owners and occupants.
- (9) Upon completion of any asbestos work, the APM should ensure that final reports are received from all contractors, including waste manifests which indicate the final destination of all asbestos waste. This information should be attached to the **Waste Tracking Form** (Appendix C). The APM should complete the **Waste Tracking Form**. This form and all investigation, laboratory, asbestos abatement, and air monitoring reports should be placed in the permanent O&M Program file.
- (10) Upon completion of asbestos abatement work, the APM or a designee should inspect the work area to ensure that asbestos abatement work is complete and that O&M work can proceed without disturbance of any ACMs, suspect ACMs, or PACMs.
- (11) Once the APM or designee has confirmed that no ACMs will be disturbed by the O&M work described on the **Job Request Form**, the O&M work can proceed. All of the activities leading up to initiation of O&M work (the above described steps) should be summarized on the **Maintenance Work Authorization Form**. This form, the **Job Request Form**, and the **APM Checklist** should be completed, signed, dated, and placed in the permanent O&M Program files. Copies of pertinent information, as listed on the **APM Checklist** should be provided to the O&M workers who will perform the actual O&M work.

The forms used in Appendices A, B and C of this O&M Work Practices Manual are reproduced from the EPA Green Book for use or guidance. Users of this O&M manual can use these documents as a basis for developing forms for their O&M Program and work permit process. It is recommended that O&M forms include the basic categories of information that are used on the Green Book forms.

**Figure 1: APM Checklist
(For O&M Work Control/Permit System)**

____ (1) Receive and review **Job Request Form** (Appendix A)

Work to be performed: _____

____ (2) Review or request survey data and inspect work area to determine whether ACM, suspect ACM, or PACM will be potentially disturbed by the O&M work. If none will be disturbed, then the O&M work can proceed without further investigation - go to number (11) below.

____ (3) ACMs, suspect ACMs, or PACMs are present in the work area and may be disturbed by the O&M work.

____ All Suspect ACMs in the work area have been tested for asbestos content, and more than 3 square feet or 3 linear feet of ACMs are present that must be abated (repaired, removed, encapsulated, or enclosed) - go to number (6) below.

____ (4) Suspect ACMs or PACMs are present that have not been tested for asbestos content.

____ (4) Either all suspect ACMs are assumed to be asbestos-containing (PACM), or a licensed asbestos inspector is engaged to survey the work area.

____ (5) The survey confirmed that no ACMs would be disturbed by O&M work – go to number (11) below.

____ (5) PACMs are present, or the survey identified ACMs that may potentially be disturbed by O&M work - go to number (6) below.

____ (6) Contract an asbestos abatement contractor to abate ACM/PACM prior to initiation of O&M work.

____ (6) Schedule work when area is not in use, or developed a plan to isolate area (if necessary).

____ (6) Federal, state and local notifications filed (if applicable).

____ (6) Notify personnel affected by work.

____ (6) Verify currency and get copies of asbestos abatement company's licensure.

____ (6) Engage a third party licensed air monitoring technician to monitor asbestos abatement work.

____ (7) Provide copies to workers/contractor of:

____ **Maintenance Work Authorization Form**

____ General Procedure(s) or abatement specifications

____ Notifications

____ Schedule of work

____ (8) Work practices during asbestos abatement work were acceptable.

____ (9) File all survey, asbestos abatement, and air monitoring records in proper files.

____ (10) Reinspection of work area after abatement did not identify any ACMs, suspect ACMs, or PACMs.

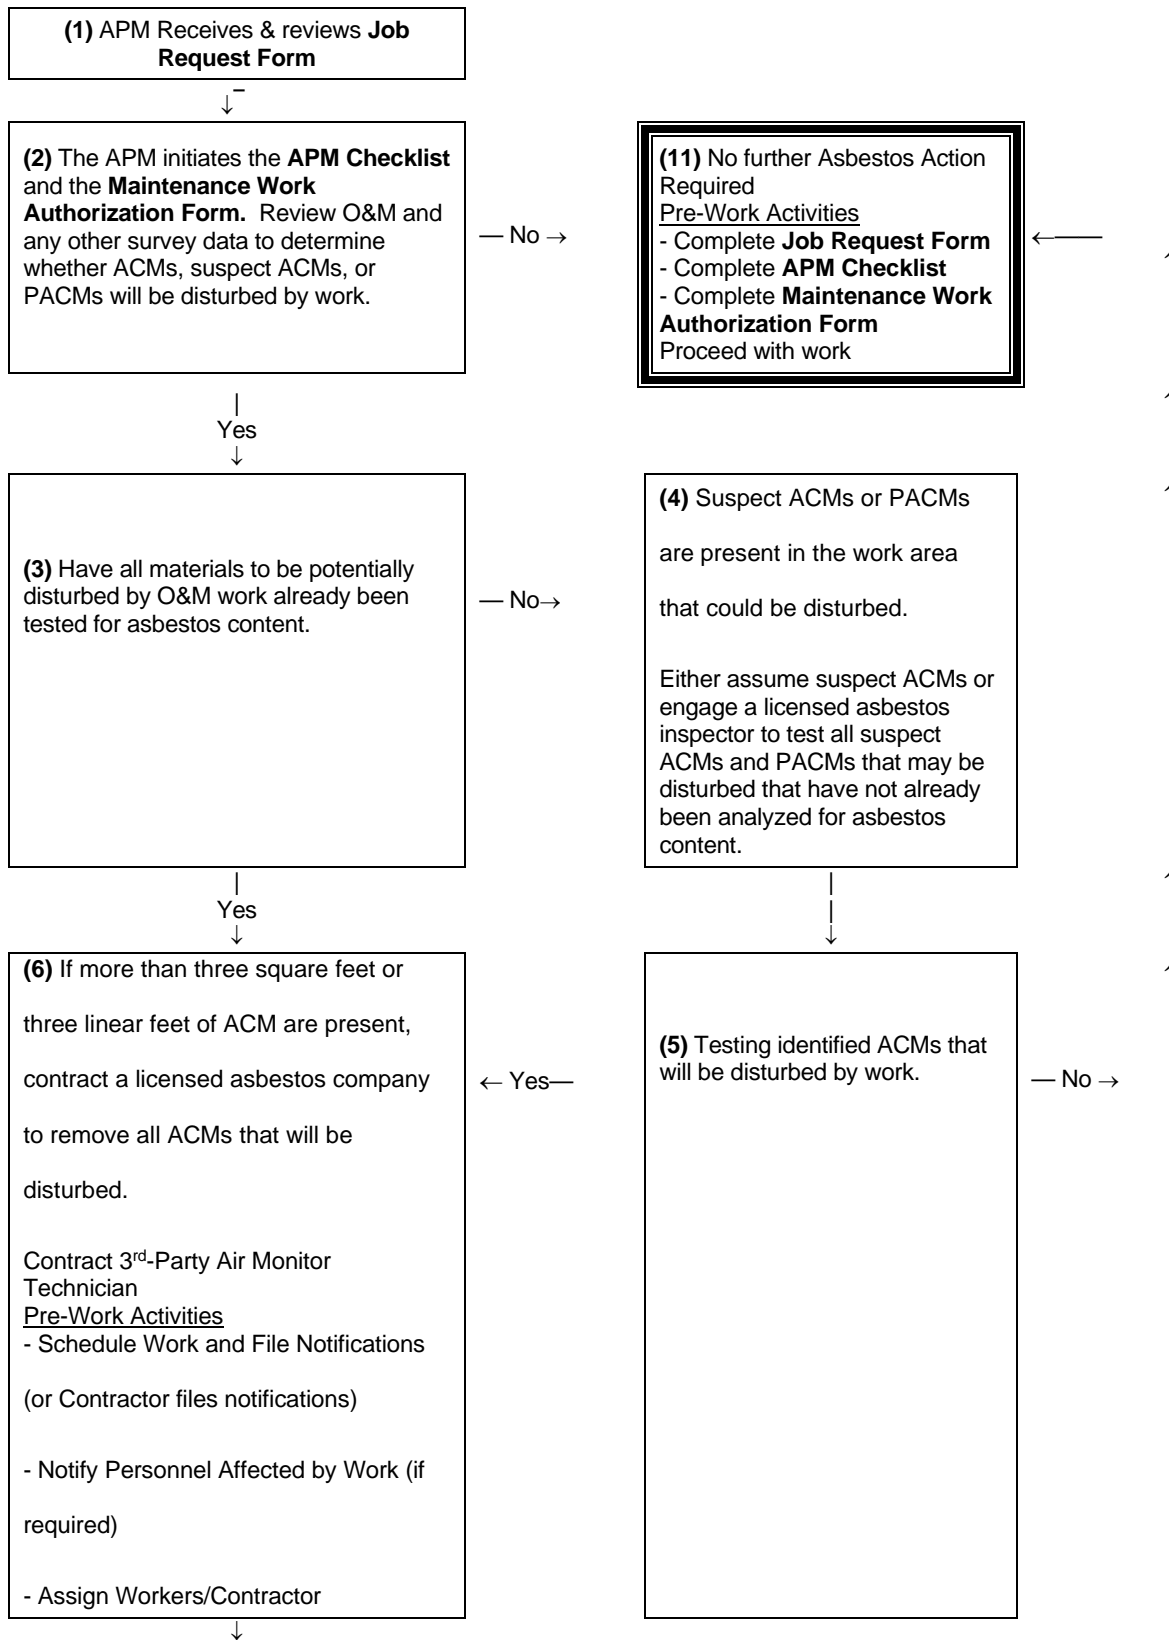

____ (11) Completed forms filed in permanent O&M file.

Signature: _____

Date: _____

Figure 2: Flowchart For O&M Work Control/Permit System

(7) Give Contractor Information for Performing Asbestos Work - Maintenance Work Authorization Form
- Copy of Notifications
- Schedule for Work
- General Procedures or Work Specifications

(8) Review contractor activities during abatement

(9) Finish Work:
- File All Required Asbestos Abatement Records

(10) Asbestos removal is complete such that no ACMs, suspect ACMs, or PACMs will be disturbed during the work.

— Yes →

10. Appendices

Appendix A: Job Request Form for Maintenance Work

Job Request Form for Maintenance Work

Name: _____

Date: _____

Telephone No. _____

Job Request No. _____

Requested starting date: _____

Anticipated finish date: _____

Address, building, and room number(s) (or description of area) where work is to be performed: _____

Description of work: _____

Description of any ACM that might be affected. If known (include location and type): _____

Name and telephone number of requester: _____

Name and telephone number of supervisor: _____

Submit this application to: _____

(Asbestos Program Manager)

NOTE: A Job Request Form must be submitted for the types of maintenance work that the APM has prescribed. Types of work requiring a Job Request Form are listed by the APM and will vary per Project. A Maintenance Work Authorization Form must then be received before any work can proceed.

_____ Granted (Job Request No. _____)

_____ With conditions*

_____ Denied

*Conditions: _____

Appendix B: Maintenance Work Authorization Form

Maintenance Work Authorization Form

No. _____

AUTHORIZATION

Authorization is given to proceed with the following maintenance work: _____

PRESENCE OF Asbestos-containing material (ACM)

- _____ ACM is not present in the vicinity of the maintenance work.
- _____ ACM is present. but its disturbance is not anticipated: however, if conditions change, the APM will re-evaluate the work request prior to proceeding.
- _____ ACM is present. and may be disturbed.

Procedures if ACMs Are Present

The following work practices shall be employed to avoid disturbing asbestos, or abatement of ACM shall be arranged prior to commencement of maintenance work: _____

Personal Protection if ACMs Are Present

The following equipment/clothes shall be used/worn during the work to protect workers: _____

(manuals on personal protection can be referenced)

Special Practices and/or Equipment Required: _____

Signed: _____

Date: _____

(Asbestos Program Manager)

Appendix C: Waste Tracking Form

Waste Tracking Form

PART 1 - TO BE COMPLETED BY APM OR CONTRACTOR:

Maintenance Work Authorization No. _____

Work Location: Building: _____

Room # or Area: _____

Type of ACM Removed: _____

Quantity of Waste generated: _____ Bags

Other containers: _____

Waste transported to: _____

Transported by: _____

Tracking Form given to: _____

PART 2 - TO BE COMPLETED BY APM

Waste Properly Packaged & Labeled: Yes _____ No _____

EXCEPTIONS: _____

Waste Storage Location: _____

Waste Disposal Location: _____

Waste Shipment Records Received: _____

Date: _____

Signed: _____

SF = Square Feet
LF = Linear Feet

* = Assumed ACM

Appendix E: Example Notification Letter

ASBESTOS NOTICE TO TENANTS OF:

Project Name: _____

Tenant: _____

In response to an environmental assessment that identified **Asbestos-Containing Materials (ACMs)** and/or **Presumed Asbestos-Containing Materials (PACMs)** at the building(s), we have implemented a written Asbestos Operations and Maintenance (O&M) Program. This O&M Program is designed to maintain all asbestos in the building(s) in good condition and prevent conditions that could cause exposure to tenants and employees. Asbestos only presents a health hazard when fibers become airborne and are inhaled. The mere presence of ACM does not represent a health hazard. All ACM is inspected periodically and additional measures are taken if needed to protect the health of building(s) occupants. Cleaning and maintenance personnel are taking special precautions during their work to properly clean up any asbestos debris and to guard against disturbing ACM.

In accordance with our O&M Program, the building(s) has been inspected for friable (easily crumbled) and non-friable materials which contain asbestos. Friable and non-friable **ACM** and **PACM** that is present in the tenant occupied or common areas of the building include the following:

Material Description	Location
Friable Materials	
Non-Friable Materials	

Tenants should note that the inspection of these materials throughout the building(s) by a trained Asbestos Program Manager (APM) did not identify any imminent tenant exposure conditions. That is, all of the ACMs/PACMs were identified in good condition and are not expected to be disturbed by routine tenant operations. Therefore, the ACM/PACM identified in and around the tenant areas can be maintained in-place through the proper implementation of an O&M Program.

As part of the O&M Program, _____ is taking steps to notify the below listed persons of the presence, location and quantity of ACM at the work sites in the building:

- Prospective employers applying or bidding for work whose employees reasonable can be expected to work in or adjacent to areas containing ACM.
- Employees of the owner who will work in or adjacent to areas containing ACM.
- All employers of employees who will be performing work within or adjacent to areas containing ACM.
- Employers of employees (commercial tenants) who will occupy areas containing ACM.

Also, as part of the O&M Program, we ask that all building(s) tenants participate in the following:

- Do not disturb ACM.
- Report any evidence of disturbance or damage of ACM to the APM.
- Report any dust or debris that might come from the ACM/PACM, any change in the condition of the ACM, or any improper action (relative to ACM) of building personnel to the APM.
- Prior to any maintenance activities, contracted maintenance activities, or other activities that may disturb any of the above-described materials or that will penetrate walls, fixed ceilings or suspended ceilings, the APM should be notified for further instruction.

A record of inspection, more detailed descriptions of materials and locations, and a copy of our O&M Program report are available from the APM for the building. The APM and alternate personnel to contact for this building are as follows:

APM: _____ (Name) _____ (Title)

Maintenance Personnel: _____

Day time phone () - _____

24-Hour Emergency () - _____

If there are any further questions regarding ACM in the building(s), please feel free to contact the APM. Please sign below and return a copy to the APM for our records.

Appendix H: General Safety Considerations

General Safety Considerations

(This section is reprinted from Appendix D of the EPA's White Book for use by personnel performing O & M activities.)

Ronald L. Stanevich

NIOSH Division of Safety Research

This guide was primarily developed to provide recommendations concerning worker respiratory protection within the asbestos abatement industry. However, employers must not lose sight of the safety hazards their employees are exposed to in performance of their work. Asbestos abatement operations can take place in a variety of industrial, commercial and public settings. Each has unique potential safety hazards that the employer must control. However, nearly all abatement operations have some common safety hazards. With proper job planning and supervision, the employer can control both the health hazards and the safety hazards faced by their workers. The more common safety hazards associated with abatement operations and general recommendations to control them are discussed below. Sources for more specific safety information are listed to supplement and support the applicable OSHA regulatory standards.

I. Elevated Work Surfaces

The nature of asbestos abatement tasks usually requires workers to work from ladders, scaffolds, manlifts, or other elevated surfaces, which creates the potential for fall injuries. Slips and falls from ladders, scaffolds, and other elevated surfaces result in a major portion of the construction industry injuries. Many of these can be prevented by implementing a few control measures:

A. General

- (1) Avoid use of makeshift work platforms by providing portable ladders and scaffolds.
- (2) Ensure that job-built elevated work surfaces are inspected by a competent person other than the individual who erects it.
- (3) Avoid working from elevated surfaces where possible. Consider use of wands for spraying amended water or scrapers with extended handles.

B. Ladders

Eighty percent of ladder-related accidents result from improper use or application.

- (1) Workers should face the ladder when climbing up, down, or working from it.
- (2) Workers should not carry objects in their hands while ascending or descending ladders. While working from a ladder they should hold on with at least one hand.
- (3) Ladders should not be used as a substitute for planks, runways, or walkboards.
- (4) Ladders should be maintained in good condition. Defective ladders should be destroyed so that no one uses them by mistake.
- (5) Ladders should have safety feet in good condition to keep the ladder from slipping and cutting through polyethylene floor covers.
- (6) Ladder rungs/steps should be kept free of contaminants such as amended water and buildup of asbestos waste.
- (7) Employees should work no higher than the fourth step/rung from the top of the ladder.
- (8) Employees should not attempt to "reach" distant objects from a ladder; other platforms should be used.
- (9) Wood or fiberglass ladders should be provided to help control exposure to electrical hazards.
- (10) Employees should not straddle the space between a ladder and another object.
- (11) Employees should make a visual inspection of ladders before each shift.

C. Scaffolds

Falls from scaffolds result in about 2,000 injuries per month in the United States. These can be reduced by

- (1) providing guardrails around the perimeter of the work surface regardless of scaffold height
- (2) securing scaffold decks against slippage
- (3) keeping scaffold uprights vertical and pinned together when stacked
- (4) ensuring vertical members are braced to keep the scaffold plumb and level
- (5) decking the entire top portion of the work surface in lieu of using minimum planking dimensions
- (6) extending planks at least 6" (150 mm) over their support and cleating or restraining them from movement
- (7) ensuring that manufacturer built-in ladders are in good condition
- (8) maintaining mobile scaffold casters in good condition with position locking devices secured when employees are working from the scaffold
- (9) keeping mobile scaffolding height less than four times the minimum base dimension and with adequate cross-bracing
- (10) never interchanging scaffolding pans from different units
- (11) never using defective scaffolding
- (12) designating only "Competent" persons to perform scaffolding repairs.

II. Electrical Hazards

Asbestos abatement is often related to renovation or remodeling activities. Normally the equipment, machinery, overhead lighting fixtures, and auxiliary furnishings are removed to facilitate the abatement work. However, it is becoming more common that industrial and commercial buildings remain partially occupied while abatement operations are performed. In either situation, the abatement operator must take positive actions to protect employees from accidentally coming into contact with energized electrical circuits.

A. General

- (1) Perform a pre-work walk-through of the abatement area to look for pre-existing electrical hazards involved with the work.
- (2) De-energize as many circuits as possible.
- (3) Verify that the circuits have been de-energized with a "Field Current Sensing Device" circuit tester. Either lock out/tag out all de-energized circuits to prevent them from accidentally being energized.
- (4) Use non-conductive tools such as scrapers and vacuum attachments made of wood, plastic, or rubber.
- (5) Provide workers with non-conductive rubber boots and/or gloves when work must be done around energized wiring or equipment.

- (6) Prohibit accumulation of puddles of water on the floor. Workers should be trained in the intelligent use of amended water. No water should be used around energized circuits.

B. Permanent Building Circuitry

- (1) Ensure that all permanent circuits are provided with a grounding system. This can be determined with a portable ground tester.
- (2) Ensure that electrical outlets are tightly sealed and taped to avoid water spray.
- (3) Determine what equipment must remain energized during the abatement process.
- (4) Insulate or guard energized equipment and Wiring from employee contact and other conductive objects.
- (5) Avoid damaging permanent building wiring during the work.
- (6) Consider dry removal methods in the vicinity of electrical equipment which must remain energized.

C. Temporary Power

- (1) All temporary circuits provided by the abatement operator must be provided with a grounding system and protected by ground fault circuit interrupters.
- (2) Avoid stringing temporary wiring across floors
- (3) Elevated wiring should not be fastened with staples, nails, or wire.
- (4) Use care not to damage the wiring insulation during Installation or abatement work.

D. Electrical Cords and Tools

- (1) Provide extension cords which have a ground conductor.
- (2) Ensure that cords are not damaged, contain no splices, and that the grounding lug on the male plug is intact.
- (3) Position extension cords to eliminate stumbling/tripping hazards and to protect them from damage by moving scaffolds.
- (4) Provide electrical tools which are either grounded or of the double-insulated type
- (5) Use shatterproof, guarded bulbs and heavy duty wiring for temporary lighting.
- (6) Where plugs enter receptacles, ensure that the connection is protected by use of duct tape or by other means.

III. Housekeeping

Asbestos abatement operations present continuous housekeeping problems. The accumulation of asbestos and other debris on polyethylene-covered floors create employee slipping and tripping hazards. It is essential that accumulation of such debris be bagged and removed from the floor as soon as possible. Even though this activity may initially require more effort, it will make final cleanup easier and the work area safer.

IV. Emergency Planning

The abatement operator should develop emergency procedures for fires or severely injured employees. Since abatement work areas must be sealed off, thereby blocking normal exits. The operator must familiarize the workers with procedures for safe exit in case of fire. Furthermore, the operator should develop plans for obtaining emergency aid in case of severe employee injury. The plans should be compatible with decontamination procedures yet provide for quick medical aid.

Appendix I: Glossary

Glossary

Acoustical Plaster Sound absorbing finishing material mill-formulated for application in areas where a reduction in sound reverberation or noise intensity is desired. These materials usually are applied in a minimum thickness of ½" (13 mm). The finish material is applied over gypsum plaster, plaster brown coat or other base plaster. The surface material is usually friable and has a rough surface appearance.

Acoustic Tile Tile-shaped blocks of sound absorbent material used for ceilings or as wall facing. May be glued to substrate or laid in a rigid grid work.

ACM Asbestos-Containing Material (Asbestos-containing Building Material). Any material containing more than one percent asbestos.

ACBM ACM found in or on the interior of a school or other building.

Adequately Wet Adequately Wet means sufficiently mix or penetrate with liquid to prevent the release of particulates. If visible emissions are observed coming from asbestos-containing material, then that material has not been adequately wetted. However, the absence of visible emissions is not sufficient evidence of being adequately wet.

AHERA Asbestos Hazard Emergency Response Act. This regulation is intended for schools (typically K-12). However, it contains the inspection protocol that accredited asbestos inspectors use in all buildings.

AIA American Institute of Architects

Air Monitoring The process of measuring the fiber content of a specific volume of air.

Amended Water Water to which a surfactant has been added for use in wetting ACM to control asbestos fibers.

APM Asbestos Program Manager

Asbestos Chrysotile, amosite, crocidolite, tremolite asbestos, anthophyllite asbestos, actinolite asbestos and any of these minerals that has been chemically treated and/or altered.

Asbestos-Containing Waste Material Mill tailings or any waste that contains commercial asbestos and is generated by a source regulated under the NESHAP. This term includes filters from control devices, friable asbestos waste material, and bags or other similar packaging contaminated with commercial asbestos. As applied to demolition and renovation operations, this term also includes regulated asbestos-containing waste and materials contaminated with asbestos including disposable equipment and clothing.

Asbestos debris Pieces of ACBM that can be identified by color, texture, or composition, or means dust, if the dust is determined by an accredited inspector to be ACM.

Asbestos Hazard Emergency Response Act (AHERA) An EPA regulation published in the October 30, 1987 Federal Register covering asbestos-containing materials in schools. AHERA requires local education agencies to identify ACM in their school buildings, develop an asbestos management plan and implement this plan. An O&M program is one permitted response action, where appropriate.

Asbestos O&M Work Cleaning, maintenance, repair or renovation work involving asbestos-containing materials where the intent of the activity is not to remove asbestos. The NESHAP requires that the owner or operator of a demolition or renovation activity conduct a thorough inspection of the affected facility or part of the facility where demolition or renovation will occur.

Asbestos Program Manager (APM) A building owner or designated representative who supervises all aspects of the facility asbestos management and control program.

Breathing Zone A hemisphere forward of the shoulders with a radius of approximately 6" to 9" (150-250 mm).

Bridging encapsulant An encapsulant that forms a discrete layer on the surface of an in situ asbestos matrix.

CFR Code of Federal Regulations

Clerk-of-the-works A representative of the architect or owner who oversees construction, handles administrative matters, and ensures that the construction is in accordance with the contract documents.

Competent Person means, in addition to the definition in 29 CFR 1926.32 (f), one who is capable of identifying existing asbestos hazards in the workplace and selecting the appropriate control strategy for asbestos exposure, who has the authority to take prompt corrective measures to eliminate them, as specified in 29 CFR 1926.32(f): in addition, for Class I and Class II work one who is specially trained in a training course which meets the criteria of EPA's Model Accreditation Plan (40 CFR part 763) for supervisor, or its equivalent and, for Class III and Class IV work, who is trained in a manner consistent with EPA requirements for training of local education agency maintenance and custodial staff as set forth at 40 CFR 763.92 (a)(2).

Compliance Instruction (Compliance Directive) Instruction issued by OSHA to establish policies and provide clarification to ensure uniform enforcement of OSHA standards.

Concealed Suspension or Concealed Spline Ceiling System Presents a monolithic ceiling surface, unobstructed by the cross-hatching of exposed grid members. Tiles are typically 12" x 12" (300 x 300 mm) or 12" x 24" (300 x 600 mm) with slots or kerfs cut into the edges of tiles for the purposes of accepting flat or "T" splines to support the tiles.

Confined Space A space that has limited openings for entry and exit, unfavorable natural ventilation and/or a space not designed for continuous worker occupancy. Examples include boilers, furnaces, pits, septic tanks, manholes, silos and utility vaults.

Critical Barrier One or more layers of polyethylene taped in place over openings into a work area. Openings to be covered include doors, windows, diffusers, and any other opening that could allow outside air into a work area.

CSRF Construction Sciences Research Foundation

Decorative Acoustic Finish: Finishing material mill-formulated and spray applied up to about 3/8" (10 mm) thick over gypsum wallboard. Material has a rough surface and is similar in appearance to acoustic plaster but is not designed for sound absorption.

Delamination Separation of one layer from another.

Disposal Bag Properly labeled 6 mil (0.15 mm) thick (or thicker) leak-tight plastic bags used for transporting asbestos waste from work and to disposal site.

Drop Cloth A layer of polyethylene on the floor of a work area to protect the floor below from contamination and to facilitate the clean-up of dust or debris generated during the work.

EJCDC Engineers Joint Contract Documents Committee

EL See Excursion Limit

Encapsulant A material that surrounds or embeds asbestos fibers in an adhesive matrix, to prevent release of fibers.

Enclosure The construction of an air-tight, impermeable, permanent barrier around asbestos-containing material to control the release of asbestos fibers into the air.

EPA U.S. Environmental Protection Agency

Excursion Limit (EL) The OSHA term used to define a maximum airborne concentration of asbestos in fibers per cubic centimeter as averaged over a sampling period of thirty minutes.

Fiber Release Any uncontrolled or unintentional disturbance of ACM resulting in visible emission.

Fireproofing Material applied to structural elements or systems which provides increased fire resistance, usually serving no structural function. This material is typically applied using spray equipment.

Friable Asbestos (See "Regulated ACM").

Glovebag A polyethylene or polyvinyl chloride bag-like enclosure affixed around an asbestos-containing source (most often, TSI) so that the material may be removed while minimizing release of airborne fibers to the surrounding atmosphere.

HEPA Filter High-Efficiency Particulate Air Filter. Such filters are rated to trap at least 99.97% of all particles 0.3 microns (0.3 mm) in diameter or larger.

HMR Hazardous Material Rules under Dept of Transportation regulations.

Initial Exposure Assessment Prior to the start of any work that may disturb ACM/PACM, the APM shall perform an assessment to determine the airborne concentrations of asbestos to which employees may be exposed. This assessment must be based on air monitoring results obtained from breathing zone air samples that are representative of the 8-hour TWA and 30-minute short term exposures of each employee. In addition, this assessment shall include consideration of all observations, information or calculations which indicated employee exposure to asbestos, including any previous monitoring conducted in the workplace, or of the operations of the employee which indicate the levels of airborne asbestos likely to be encountered on the job.

MAP EPA Interim Final Model Accreditation Plan (MAP) for asbestos abatement worker training (40 CFR Part 763, Subpart E, Appendix C).

Medical Surveillance A periodic comprehensive review of a worker's health status. The required elements of an acceptable medical surveillance program are listed in the Occupational Safety and Health Administration standards for asbestos.

Mini-Enclosure An enclosure constructed of polyethylene sheeting used for small scale, short duration asbestos maintenance or renovation work. Mini-enclosures can be small enough to restrict entry to the asbestos work area to one worker. Appendix G to OSHA regulation 29 CFR 1926.58 discusses mini-enclosures and recommends that a change room be constructed contiguous to the mini-enclosure.

Miscellaneous ACM Interior asbestos-containing building material on structural components, structural members or fixtures, such as floor and ceiling tiles; does not include surfacing material or thermal system insulation.

NEA Negative Exposure Assessment

Negative Exposure Assessment A demonstration by the employer which complies with criteria in paragraph (f)(2)(iii) of 29 CFR 1926.1101, that employee exposure during an operation is expected to be consistently below the PELs.

Negative Pressure System A local exhaust system intended to prevent the escape of contaminated air to the surrounding environment. It utilizes HEPA filtration capable of maintaining a pressure differential with a lower pressure inside the Work Area than in any adjacent area. This system recirculates clean air and/or generates a constant flow of air from adjacent areas into the work area.

Negative Pressure Respirator A respirator in which the air pressure inside the respiratory-inlet covering is positive during exhalation in relation to the air pressure of the outside atmosphere and negative during inhalation in relation to the air pressure of the outside atmosphere.

NESHAP National Emission Standard for Hazardous Air Pollutants - EPA Rules under the Clean Air Act (40 CFR Part 61).

NIOSH The National Institute for Occupational Safety and Health, which was established by the Occupational Safety and Health Act of 1970. Primary functions of NIOSH are to conduct research, issue technical information, and certify respirators.

O&M Operations & Maintenance

Operations & Maintenance (O&M) Program A program of work practices to maintain ACM in good condition, ensure clean up of asbestos fibers previously released, and prevent further release by minimizing and controlling ACM disturbance or damage.

Occupied Area An area where personnel are present and are performing their normal activities intended for the area (such as in a typical office area from 8:00 to 5:00 p.m., Monday through Friday).

OSHA Occupational Health & Safety Administration.

PAPR Powered Air Purifying Respirator.

Penetrating Encapsulant An encapsulant that is absorbed by the in situ asbestos matrix without leaving a discrete surface layer.

PELs Permissible Exposure Limits.

Personal Air Samples An air sample taken with a sampling pump directly attached to the worker with the collecting filter and cassette placed in the worker's breathing zone. These samples are required by the OSHA asbestos standards and the EPA Worker Protection Rule.

PCM Phase Contrast Microscopy

Phase Contrast Microscopy (PCM) A method of analysis using a light microscope, used to find the concentration of airborne fibers. Does not distinguish among asbestos and other fibers. Used by OSHA to find personal exposures, and by EPA to find area levels for AHERA project clearance.

Plenum Any space to convey air in a building or structure. The space above a suspended ceiling is often used as an air plenum. This term is also used in the work practices to refer to spaces above a ceiling not used to convey air.

PLM Polarized Light Microscopy

Polarized Light Microscopy (PLM) A method of analysis using a light microscope to find the chemical or mineral types of samples, including the concentration of asbestos in bulk materials. Used by EPA for AHERA and NESHAP, and by OSHA to see if asbestos is involved in a project.

Project Representative Architect's representative at the project site who assists in the administration of the construction contract.

Protection Factor The ratio of the ambient concentration of an airborne substance to the concentration of the substance inside the respirator at the breathing zone of the wearer. The protection factor is a measure of the degree of protection provided by a respirator to the wearer.

RCRA Resource Conservation and Recovery Act.

RACM Regulated ACM

Regulated ACM (RACM) As defined by NESHAP in the November 20, 1990 Federal Register, **regulated asbestos-containing material (RACM)** means (a) Friable asbestos material, (b) Category I nonfriable ACM that has become friable, (c) Category I nonfriable ACM that will be or has been subjected to sanding, grinding, cutting, or abrading, or (d) Category II nonfriable ACM that has a high probability of becoming or has become crumbled, pulverized, or reduced to powder by the forces expected to act on the material in the course of demolition or renovation operations regulated by this subpart.

(Note: Regulated ACM is an EPA NESHAP concept. OSHA makes no distinction between friable and non-friable asbestos).

"Cutting" means to penetrate with a sharp-edged instrument and includes sawing, but does not include shearing, slicing or punching.

"Grinding" means to reduce powder or small fragments and includes mechanical clipping or drilling.

Friable asbestos material means any material containing more than 1 percent asbestos as determined using the method specified under AHERA (40 CFR Part 763, Sub-part F, Appendix A, section 1, Polarized Light Microscopy) that, when dry, can be crumbled, pulverized, or reduced to powder by hand pressure. If the asbestos content is less than 10 percent as determined by a method other than point counting by polarized light microscopy (PLM), verify the asbestos content by point counting using PLM.

Category I nonfriable asbestos-containing material (ACM) means asbestos-containing packings, gaskets, resilient floor covering and asphalt roofing products containing more than 1 percent asbestos as determined using the method specified under AHERA.

Category II nonfriable ACM means any material, excluding Category I nonfriable ACM. containing more than 1 percent asbestos as determined using the methods specified under AHERA, when dry, cannot be crumbled, pulverized, or reduced to powder by hand pressure.

Remove For Operations and Maintenance work on ACM, "remove" refers to the removal of ACM as needed to perform a maintenance or repair O & M activity.

Removal Encapsulant A penetrating encapsulant specifically designed to minimize fiber release during removal of asbestos-containing materials rather than for in situ encapsulation.

Repair Returning damaged ACBM to an undamaged condition or to an intact state so as to prevent fiber release.

Respirator A device designed to protect the wearer from the inhalation of harmful particulates.

Small-scale, Short-duration Term formerly used by OSHA to describe O&M work activities (in the previous OSHA construction standard). This term has been superseded by the work class definitions in the current OSHA standard.

Surfacing ACM Asbestos-containing material that is sprayed-on, troweled-on or otherwise applied to surfaces, such as acoustical plaster on ceilings and fireproofing materials on structural member, or other materials on surfaces for acoustical, fireproofing, or other purposes.

Survey An asbestos survey is what EPA calls an inspection in the AHERA regulation. It consists of a visual and tactile inspection of a building to identify, quantify and assess the accessibility and condition of the ACM and suspected ACM present.

Suspended "T" Bar Ceiling System A false or dropped ceiling composed of acoustic tiles laid into an inverted metal "T" bar grid frame suspended by wires from building framing members.

Surfactant A chemical wetting agent added to water to improve penetration, thus reducing the quantity of water required for a given operation or area.

TEM Transmission Electron Microscopy

Temporary Barriers One or more layers of 6 mil polyethylene installed to isolate a work area from other portions of a facility.

Thermal System Insulation (TSI) Thermal system insulation - asbestos-containing material applied to pipes, fittings, boilers, breeching, tanks, ducts or other interior structural components to prevent heat loss or gain or water condensation.

Time Weighted Average (TWA) In air sampling, this refers to the average air concentration of contaminants during a particular time period.

TSI Thermal System Insulation

Transmission Electron Microscopy (TEM) A method of analysis using an electron microscope, used to find and analyze the concentration of airborne or bulk asbestos fibers and structures. Distinguishes among asbestos and other materials; can detect smaller asbestos fibers than does PCM. Used by EPA to find area concentrations for large AHERA project clearance.

TSCA Toxic Substances Control Act

TWA Time Weighted Average.

Work Area The area where asbestos-related work or removal operations are performed which is defined and/or isolated to prevent the spread of asbestos dust, fibers or debris, and entry by unauthorized personnel.

Work Practices Procedures designed to be followed to avoid or minimize fiber release during activities affecting ACM.

1. Executive Summary

Bureau Veritas performed an Asbestos Inspection that included on site observations of the accessible areas of Nelson Park Apartments (the "Project"), on May 22–June 16, 2023. The Project is located at 1994 Maryland Avenue, Columbus, Ohio 43219.

The following summarizes the independent conclusions representing Bureau Veritas's best professional judgment based on information and data available to us during the course of this assignment. Factual information regarding operations, conditions, and test data provided by the Client, owner, or their representative has been assumed to be correct and complete. Additionally, the conclusions presented are based on the conditions that existed at the time of the assessment.

Bureau Veritas collected and analyzed one thousand five hundred six (1,506) bulk samples with laboratory analysis of bulk samples showing asbestos to be present (>1% by weight) in one hundred seventy-two (172) samples. <1% Asbestos was detected in eight (8) materials.

2. Certification

Bureau Veritas has completed an Asbestos Inspection of Nelson Park Apartments (the "Project"), located at 1994 Maryland Avenue, Columbus, Ohio 43219. The inspection was performed at the Client's request using the methods and procedures consistent with good commercial and customary practice designed to conform to acceptable industry standards.

This report has been prepared for and is exclusively for the use and benefit of the Client identified on the cover page of this report. The purpose for which this report shall be used shall be limited to the use as stated in the contract between the client and Bureau Veritas.

This report, or any of the information contained therein, is not for the use or benefit of, nor may it be relied upon by any other person or entity, for any purpose without the advance written consent of Bureau Veritas. Any reuse or distribution without such consent shall be at the client's or recipient's sole risk, without liability to Bureau Veritas.

The independent conclusions represent our professional judgment based on information and data available to us during the course of this assignment. Factual information regarding operations, conditions, and test data provided by the Client or their representative has been assumed to be correct and complete. The conclusions presented are based on the data provided, observations, and conditions that existed on the date of the onsite visit.

If you have any questions regarding this report, please contact Deirdre Fontaine at (800) 733-0660, Ext. 7296337.

Prepared by:

Deirdre Fontaine

Expanded Environmental Services Specialist
Bureau Veritas

3. Survey Scope

This survey was conducted at the request of the Client for the purpose of identifying asbestos-containing materials (ACM) throughout the Project in the area to be affected by the renovation.

A Licensed Asbestos Building Inspector visually inspected the building for suspect ACMs. Methodologies used were generally consistent with USEPA publications: "Guidance for Controlling Asbestos Containing Materials in Buildings" (June 1985) and "Asbestos in Buildings: Simplified Sampling Scheme for Friable Surfacing Materials" (dated October 1985). The documents were used for their asbestos survey concepts, such as identifying homogeneous materials, quantifying materials, and evaluating friability (potential to crumble with hand pressure) and condition (good, damaged). Over 3,000 products are currently known to contain asbestos. Although no comprehensive list of asbestos containing materials exists, Bureau Veritas utilized the USEPA's "Sample List of Suspect Asbestos-Containing Materials" as a general guide to identify and document suspect asbestos containing materials within the building. In addition, in some cases, the Bureau Veritas inspector utilized their experience and the knowledge obtained through training courses to identify suspect asbestos containing materials.

During the survey, the inspector classified each suspect ACM as one of three types: 1) surfacing material applied by spray or trowel, 2) thermal system insulation on pipes, tanks, boilers and related features, or 3) miscellaneous material not classified as surfacing material or thermal system insulation. The inspector touched all assumed or suspected materials on all surfaces, including walls, ceilings, structural members, and mechanical equipment, to determine their friability, or the extent to which the material, when dry, may be crumbled, pulverized, or reduced to powder by hand pressure. It should be noted that in accordance with the Occupational Safety and Health Administration (OSHA), Asbestos Construction Standard 29 CFR 1926.1101, any thermal system insulation, surfacing materials, floor tiles, roofing felts and shingles found in buildings constructed no later than January 1, 1981 are presumed asbestos containing materials.

3.1. Limitations to the ACM Survey

Bureau Veritas inspected all reasonable accessible spaces of the building, including basements, storage rooms, utility rooms, attics, and crawl spaces.

Areas that were not accessible without significantly destructive methods (fire doors) or that were contained within non-functional building spaces or were part of energized equipment (boilers, air handlers, electrical, etc.) were not inspected. ACM in non-functional spaces would not typically be expected to pose a hazard to human health or the environment as long as these materials remain enclosed, are not part of the circulating air system and are inaccessible to the building occupants.

Suspected ACM subsequently identified or encountered in non-functional, inaccessible areas during demolition should be assumed to contain asbestos unless testing confirms otherwise. In addition, all flooring materials were not sampled under the scope of this inspection and therefore assumed asbestos containing materials.

Roofing materials were not sampled at the time of the assessment because roof sampling would invalidate existing roof warranties. Fire doors were not sampled because the damage caused by sampling would render these materials friable and may also void the fire rating. Flexible fabric vibration isolators were not sampled because the damage caused by sampling would render these materials friable and may cause a fiber release into the tempered air supply ducting. Since these materials were not sampled, they should be assumed to be asbestos-containing, unless sampled and proven otherwise. Sampling of these assumed ACMs should be performed prior to any renovation or other activity that may cause a material disturbance.

3.2. Survey and Sample Collection Procedure

The Asbestos Inspection was performed on May 22 through June 16, 2023. The inspection consisted of a walk-through and visual observations of the accessible interior areas for suspect ACM, assessing the ACM for condition, friability, and the collection of bulk samples.

Samples of suspect ACM were taken in accordance with USEPA protocol and were collected by Michael Rombke who is an Ohio Licensed Asbestos Inspector. A total of one thousand five hundred six (1,506) bulk samples were collected and analyzed to facilitate the inspection. All samples were transported for analysis to Schneider Laboratories Global, Inc., and Pinnacle Consultants both of which are accredited by the American Industrial Hygiene Association (AIHA) and successfully participates in the National Voluntary Laboratory Accreditation Program (NVLAP). Rigorous chain-of-custody guidelines were followed to ensure proper handling and delivery of the samples.

The samples were analyzed for asbestos by polarized light microscopy (PLM) in accordance with the "EPA Method for the Determination of Asbestos in Bulk Building Materials." Analysis was performed by using the bulk sample for visual observation and slide preparation, and for microscopic examination and identification. The samples were mounted on slides and then analyzed for asbestos (chrysotile, amosite, crocidolite, anthophyllite, actinolite/tremolite), and fibrous non-asbestos constituents (mineral wool, fiberglass, cellulose, etc.). Asbestos was identified by refractive indices, morphology, color, and signs of elongation. The same characteristics were used to identify the non-asbestos constituents. The microscopist visually estimated relative amounts of each constituent by determining the volume of each constituent in proportion to the total volume of the sample, using a stereoscope.

During the inspection, location and friability of each suspect material were recorded.

3.3. Summary of Laboratory Results

3.3.1. ASBESTOS-CONTAINING MATERIALS

The table below describes materials that were sampled as part of the inspection and found to contain asbestos by laboratory analysis via PLM. Sample numbers presented in the tables correspond to the sample numbers on the Laboratory Analysis Reports, which are included in Appendix A. Also presented below are the assessed friability, condition, and approximate quantity for each identified ACM.

Nelson Park Apartments 1994 Maryland Avenue, Columbus, Ohio 43219 ACM						
Sample Number	Material Description	Location	Friable	% Asbestos	Condition	Estimated Quantity
Building 1 Units 500 - 506						
1433, 1434, 1435	Paper Wrap on Duct	Unit 500 - Front Bedroom in Wall	Yes	40% Chrysotile	Intact	4 SF
1436	Paper Wrap on Duct	Unit 500 - Front Bedroom in Ceiling	Yes	40% Chrysotile	Intact	10 SF
1449	Joint Compound	Unit 502 – Furnace Room	Yes	2% Chrysotile	Intact	4 LF
Building 2 Units 494, 496 and 1864						
1483	Paper Tape	Unit 494 – Furnace Room Duct	Yes	60% Chrysotile	Intact	12 SF
1491	Drywall and Joint Compound	Unit 496 – Furnace Room Wall	Yes	2% Chrysotile	Intact	108 SF
Building 3 Units 1872 to 1878						
1520	Paper Tape	Unit 1872 – Furnace Room Duct	Yes	60% Chrysotile	Intact	4 SF
1521	Vibration Joint	Unit 1874 – Furnace Room Duct	Yes	60% Chrysotile	Intact	4 SF

Building 4 Units 1900 to 1906						
1552	Paper Tape	Unit 1906 – Duct in Bathroom Floor	Yes	60% Chrysotile	Intact	2 SF
1564	Paper Wrap	Unit 1902 – Duct in Front Room Floor	Yes	45% Chrysotile	Intact	2 SF
Building 5 Units 1912 to 1918						
1582	Paper Wrap	Unit 1914 - Duct in Bedroom - 1	Yes	60% Chrysotile	Intact	2 SF
1594	Paper	Unit 1914 – Duct Inside Wall Bedroom 2	Yes	60% Chrysotile	Intact	2 SF
2880	Exterior Caulk	Unit 1916	No	2% Chrysotile	Intact	570 LF
Building 6 Units 1922 to 1928						
1622	Paper Tape	Unit 1924 – Duct in Bedroom 1	Yes	60% Chrysotile	Intact	2 SF
1634	Paper Wrap	Unit 1924 – Duct Inside Wall Bedroom 2	Yes	60% Chrysotile	Intact	20 SF
Building 7 Units 1934 – A, B, C, D						
1654	Paper Tape	Unit B – Furnace Room Duct	Yes	40% Chrysotile	Intact	2 SF
1664	Paper Wrap	Unit B – Duct in Bedroom	Yes	40% Chrysotile	Intact	2 SF
2883	Exterior Caulk	Unit 1934 – Window	No	2% Chrysotile	Intact	570 LF

Building 8 Units 1938 – A, B, C, D						
1744	Drywall Tape Joint Compound	Unit D – Bedroom 1 Wall	Yes	2% Chrysotile	Intact	108 SF
1752	Paper Tape	Unit A – Bedroom 1 Duct	Yes	60% Chrysotile	Intact	2 SF
1764	Paper Wrap on Duct	Unit B – 3 rd Floor Bedroom	Yes	60% Chrysotile	Intact	2 SF
Building 9 Units 1940 – A, B, C, D						
1714	Drywall Tape and Joint Compound	Unit A – Living Room Closet Wall	Yes	2% Chrysotile	Intact	108 SF
1716	Drywall Composite	Unit A – Living Room Closet Wal	Yes	2% Chrysotile	Intact	108 SF
1716	Drywall Composite 2 nd layer	Unit A – Living Room Closet Wal	Yes	<1% Chrysotile	Intact	108 SF
1722	Paper Tape	Unit D – Bedroom 1 Duct	Yes	60% Chrysotile	Intact	4 SF
1724	Vibration Joint	Unit D – Furnace Room Duct	Yes	60% Chrysotile	Intact	4 SF
1734	Paper Wrap on Duct	Unit D – Bedroom Room 2 Inside Wall	Yes	60% Chrysotile	Intact	2 SF

The USEPA and State of Ohio define asbestos-containing materials (ACM) as those which contain greater than one percent asbestos. Of the one thousand five hundred six (1,506) samples that were analyzed, one hundred seventy-two (172) materials were found to contain asbestos.

3.3.2. NON-ASBESTOS MATERIALS

The table below describes the materials that were sampled as part of the inspection at the Project and found not to contain asbestos by laboratory analysis via PLM. Sample numbers presented in the tables correspond to the sample numbers on the Laboratory Analysis Reports, which are included in Appendix A.

Nelson Park Apartments 1994 Maryland Avenue, Columbus, Ohio 43219 Negative Materials			
Sample Number	Material	Friable/Non-Friable	Condition
Building 1 Units 500 - 506			
1431, 1432, 1438, 1439, 1440	White Joint Compound	Friable	Intact
1437, 1448	Brown Cove Base and associated Mastic	Non-Friable	Intact
1441, 1446	Gray Blow-In Insulation	Friable	Intact
1442, 1447	Brown Blow-In Insulation	Friable	Intact
1443	Drywall Texture	Friable	Intact
1444, 1445, 1455, 1456	Rough Drywall Texture	Friable	Intact
1450, 1451, 1459, 1460, 1461	Drywall	Friable	Intact
1453, 1454	Ceiling Texture	Friable	Intact
1458, 1462	Vibration Joint	Non-Friable	Intact
2871, 2872	Exterior Caulk	Non-Friable	Intact

Building 2 Units 494, 496 and 1864			
1471, 1472, 1473, 1494, 1495	Ceiling Texture	Friable	Intact
1474, 1475, 1476, 1477, 1496, 1497, 1498	Drywall Texture	Friable	Intact
1478, 1479	Gray Blow-In Insulation	Friable	Intact
1480, 1481, 1482, 1492, 1493	Drywall and Compound	Friable	Intact
1484, 1489	Vibration Joint	Friable	Intact
1485, 1486	Brown Blow-In Insulation	Friable	Intact
1487, 1499	Brown Cove Base and associated Mastic	Non-Friable	Intact
1488, 1500	White Interior Caulk	Non-Friable	Intact
2873, 2874	Exterior Caulk	Non-Friable	Intact
Building 3 Units 1872 to 1878			
1501, 1502, 1503, 1504, 1505, 1506, 1507	Drywall Texture	Friable	Intact
1508, 1509, 1510, 1511, 1512	Ceiling Texture	Friable	Intact
1513, 1514, 1515, 1516, 1517, 1518	Drywall Tape and Compound	Friable	Intact
1523, 1524	White Interior Caulk	Non-Friable	Intact
1525, 1526	Brown Cove Base	Non-Friable	Intact
1527, 1528	Gray Blow-In Insulation	Friable	Intact
1529, 1530	Brown Blow-In Insulation	Friable	Intact
2875, 2875	Exterior Caulk	Non-Friable	Intact

Building 4 Units 1900 to 1906			
1541, 1542, 1543, 1544, 1545, 1546	Drywall Tape and Compound	Friable	Intact
1547, 1548, 1549, 1550, 1551, 1567, 1568, 1569	Ceiling Texture	Friable	Intact
1554, 1555	Vibration Joint	Friable	Intact
1558, 1559	Brown Cove Base	Non-Friable	Intact
1560, 1561	Gray Blow-In Insulation	Friable	Intact
1562, 1563	Brown Blow-In Insulation	Friable	Intact

1656, 1657	White Interior Caulk	Non-Friable	Intact
1658, 1659	Gray Blow-In Insulation	Friable	Intact
1660, 1661	Brown Blow-In Insulation	Friable	Intact
1622, 1663	Brown Cove Base	Non-Friable	Intact

Building 8 Units 1938 – A, B, C, D			
1742, 1743	Drywall Board	Friable	Intact
1745, 1746	Drywall Composite	Friable	Intact
1747, 1748, 1749, 1750, 1751	Ceiling Texture	Friable	Intact
1754, 1755	Vibration Joint	Friable	Intact
1756, 1757	White Interior Caulk	Non-Friable	Intact
1758, 1759	Gray Blow-In Insulation	Friable	Intact
1760, 1761	Brown Blow-In Insulation	Friable	Intact
1762, 1763	Brown Cove Base	Non-Friable	Intact
2885, 2886	Exterior Caulk	Non-Friable	Intact
Building 9 Units 1940 – A, B, C, D			
1711, 1714	Drywall Tape and Compound	Friable	Intact
1712, 1715	Drywall Board	Friable	Intact
1717, 1718, 1719, 1720, 1721	Ceiling Texture	Friable	Intact
1726, 1727	White Interior Caulk	Non-Friable	Intact
1728, 1729	Gray Blow-In Insulation	Friable	Intact
1730, 1731	Brown Blow-In Insulation	Friable	Intact
1732, 1733	White Cove Base	Non-Friable	Intact

Building 10 – 1942 – A, B, C, D			
1671, 1674	Drywall Tape and Compound	Friable	Intact
1672, 1675	Drywall Board	Friable	Intact
1673, 1676	Drywall Composite	Friable	Intact
1677, 1678, 1679, 1680	Ceiling Texture	Friable	Intact
1684, 1685	Vibration Joint	Friable	Intact
1686, 1687	White Interior Caulk	Non-Friable	Intact
1688, 1689	Gray Blow-In Insulation	Friable	Intact
1690, 1691	Brown Blow-In Insulation	Friable	Intact
1692, 1693	Brown Cove Base	Non-Friable	Intact
1694, 1695, 1696	Paper Wrap on Duct	Friable	Intact
1700, 1701, 1702, 1703, 1704	Texture on Drywall	Friable	Intact
Building 11 Unit 1950 - 1956			
1772, 1775	Drywall Board	Friable	Intact
1773, 1776	Drywall Composite	Friable	Intact
1777, 1778, 1779, 1780, 1781	Ceiling Texture	Friable	Intact
1786, 1787	White Interior Caulk	Non-Friable	Intact
1788, 1789	Gray Blow-In Insulation	Friable	Intact
1790, 1791	Brown Blow-In Insulation	Friable	Intact
1792, 1793	Brown Cove Base	Non-Friable	Intact
2891, 2892	Exterior Caulk	Non-Friable	Intact

Building 12 – 1958 – A, B, C, D			
1801, 1803	Drywall Tape and Compound	Friable	Intact
1804, 1806	Drywall Composite	Friable	Intact
1802, 1805	Drywall Board	Friable	Intact
1807, 1808, 1809, 1810, 1811	Ceiling Texture	Friable	Intact
1812, 1813	Paper Tape	Friable	Intact
1816, 1817	White Interior Caulk	Non-Friable	Intact
1818, 1819	Gray Blow-In Insulation	Friable	Intact
1820, 1821	Brown Blow-In Insulation	Friable	Intact
1822, 1823	Brown Cove Base	Non-Friable	Intact
1824, 1825, 1826	Paper Wrap on Duct	Friable	Intact
Building 13 – 1960 – A, B, C, D			
1832, 1833	Dry Board	Friable	Intact
1835, 1836	Drywall Composite	Friable	Intact
1837, 1838	White Interior Caulk	Non-Friable	Intact
1839, 1840	Brown Cove Base	Non-Friable	Intact
1841, 1842, 1843, 1844, 1845	Ceiling Texture	Friable	Intact
1851, 1852	Paper Wrap on Duct	Friable	Intact
1853, 1854	Gray Blow-In Insulation	Friable	Intact
1855, 1856	Brown Blow-In Insulation	Friable	Intact
1857, 1858, 1859	Rough Texture on Drywall	Friable	Intact

Building 14 – 1962 – A, B, C, D			
1862, 1865	Drywall Board	Friable	Intact
1867, 1868	White Interior Caulk	Non-Friable	Intact
1869, 1870	Brown Cove Base	Non-Friable	Intact
1871, 1872, 1873, 1874, 1875	Ceiling Texture	Friable	Intact
1876, 1877	Vibration Joint	Friable	Intact
1881, 1882	Paper Wrap on Duct	Friable	Intact
1883, 1884	Gray Blow-In Insulation	Friable	Intact
1885, 1886	Brown Blow-In Insulation	Friable	Intact
1887, 1888, 1889	Rough Texture on Wall	Friable	Intact
Building 15 – 1964, 1966, 1970, 1972			
1891, 1893	Drywall Tape and Compound	Friable	Intact
1894, 1896	Drywall Composite	Friable	Intact
1892, 1895	Drywall Board	Friable	Intact
1897, 1898	White Interior Caulk	Non-Friable	Intact
1899, 1900	Brown Cove Base	Non-Friable	Intact
1901, 1902, 1903, 1904, 1905	Ceiling Texture	Friable	Intact
1906, 1907	Vibration Joint	Friable	Intact
1911, 1912	Paper Wrap on Duct	Friable	Intact
1913, 1914	Gray Blow-In Insulation	Friable	Intact
1915, 1916	Brown Blow-In Insulation	Friable	Intact

Building 16 – 1978 – A, B, C, D			
1922, 1925	Drywall Board	Friable	Intact
1927, 1928	White Interior Caulk	Non-Friable	Intact
1929, 1930	Brown Cove Base	Non-Friable	Intact
1931, 1932, 1933, 1934, 1935	Ceiling Texture	Friable	Intact
1936, 1937	Vibration Joint	Friable	Intact
1941, 1942	Paper Wrap on Duct	Friable	Intact
1943, 1944	Gray Blow-In Insulation	Friable	Intact
1945, 1946	Brown Blow-In Insulation	Friable	Intact
1947, 1948, 1949, 1950, 1951, 1952, 1953	Rough Texture on Drywall	Friable	Intact
2901, 2902	Exterior Caulk	Non-Friable	Intact
Building 17 – 1982 – A, B, C, D			
1962, 1965	Drywall Board	Friable	Intact
1967, 1968	White Interior Caulk	Non-Friable	Intact
1969, 1970	Brown Cove Base	Non-Friable	Intact
1971, 1972, 1973, 1974, 1975	Ceiling Texture	Friable	Intact
1976, 1977	Vibration Joint	Friable	Intact
1981, 1982	Paper Wrap on Duct	Friable	Intact
1983, 1984, 1985, 1986, 1987, 1988, 1989	Rough Texture on Drywall	Friable	Intact

Building 18– 1984 – A, B, C, D			
1922, 1995	Drywall Board	Friable	Intact
1993, 1996	Drywall Composite	Friable	Intact
1997, 1998	White Interior Caulk	Non-Friable	Intact
1999, 200	Cove Base	Non-Friable	Intact
2001, 2002, 2003, 2004, 2005	Ceiling Texture	Friable	Intact
2006, 2007	Vibration Joint	Friable	Intact
2011, 2012	Paper Wrap on Duct	Friable	Intact
2013, 2014	Gray Blow-In Insulation	Friable	Intact
2015, 2016, 2017, 2018, 2019, 2020	Rough Texture on Drywall	Friable	Intact
Building 19– 1986 – A, B, C, D			
2032, 2035	Drywall Board	Friable	Intact
2033, 2036	Drywall Composite	Friable	Intact
2037, 2038	Vibration Joint	Friable	Intact
2041, 2042, 2043, 2044, 2045	Ceiling Texture	Friable	Intact
2046, 2047, 2048, 2049, 2050, 2051	Rough Texture on Drywall	Friable	Intact
2907, 2908	Exterior Caulk	Non-Friable	Intact

Building 20 – 2004 – A, B, C, D			
2062, 2065	Drywall Board	Friable	Intact
2063, 2066	Drywall Composite	Friable	Intact
2067, 2068	White Interior Caulk	Non-Friable	Intact
2069, 2070	Cove Base	Non-Friable	Intact
2071, 2072, 2073, 2074, 2075	Ceiling Texture	Friable	Intact
2076, 2077	Vibration Joint	Friable	Intact
2082, 2083	Gray Blow-In Insulation	Friable	Intact
2084, 2085, 2086, 2087, 2088, 2089, 2090	Rough Texture on Drywall	Friable	Intact
Building 21 – 2006 – A, B, C, D			
2092, 2095	Drywall Board	Friable	Intact
2093, 2096	Drywall Composite	Friable	Intact
2097, 2098	White Interior Caulk	Non-Friable	Intact
2099, 2100	Cove Base	Non-Friable	Intact
2101, 2102, 2103, 2104, 2105	Ceiling Texture	Friable	Intact
2106, 2107	Vibration Joint	Friable	Intact
2112, 2113, 2114, 2115, 2116, 2117, 2118	Rough Ceiling Texture	Friable	Intact
2119, 2120	Brown Blown-In Insulation	Friable	Intact
2121, 2122	Gray Blow-In Insulation	Friable	Intact
2913, 2914	Exterior Caulk	Non-Friable	Intact

Building 22 – 2010 – A, B, C, D			
2132, 2135	Drywall Board	Friable	Intact
2137, 2138	White Interior Caulk	Non-Friable	Intact
2139, 2140	Cove Base	Non-Friable	Intact
2141, 2142, 2143, 2144, 2145	Ceiling Texture	Friable	Intact
2146, 2147	Vibration Joint	Friable	Intact
2152, 2153, 2154, 2155, 2156, 2157, 2158	Rough Texture on Drywall	Friable	Intact
Building 23 – 2014 – A, B, C, D			
2162, 2165	Drywall Board	Friable	Intact
2163, 2166	Drywall Composite	Friable	Intact
2167, 2168	White Interior Caulk	Non-Friable	Intact
2169, 2170	Cove Base	Non-Friable	Intact
2171, 2172, 2173, 2174, 2175	Ceiling Texture	Friable	Intact
2176, 2177	Vibration Joint	Friable	Intact
2182, 2183, 2184, 2185, 2186, 2187, 2188	Rough Texture on Drywall	Friable	Intact
2189, 2190	Brown Blow-In Insulation	Friable	Intact

Building 24 – 2020, 2022, 2024, 2026			
2192, 2195	Drywall Board	Friable	Intact
2193, 2196	Drywall Composite	Friable	Intact
2197, 2198	White Interior Caulk	Non-Friable	Intact
2199, 2200	White Cove Base	Non-Friable	Intact
2201, 2202, 2203, 2204, 2205	Ceiling Texture	Friable	Intact
2206, 2207	Vibration Joint	Friable	Intact
2212, 2213, 2214, 2215, 2216, 2217, 2218	Rough Texture on Drywall	Friable	Intact
2219, 2220	Brown Blow-In Insulation	Friable	Intact
2221, 2222	Gray Blow-In Insulation	Friable	Intact
Building 25 – 2032 – A, B, C, D			
2232, 2235	Drywall Board	Friable	Intact
2233, 2236	Drywall Composite	Friable	Intact
2237, 2238	White Interior Caulk	Non-Friable	Intact
2239, 2240	Brown Cove Base	Non-Friable	Intact
2241, 2242, 2243, 2244, 2245	Texture on Ceiling	Friable	Intact
2246, 2247	Vibration Joint	Friable	Intact
2252, 2253, 2254, 2255, 2256, 2257, 2258	Rough Texture on Drywall	Friable	Intact
2259, 2260	Brown Blow-In Insulation	Friable	Intact
2261, 2262	Gray Blow-In Insulation	Friable	Intact

Building 26 – 2038 – A, B, C, D			
2272, 2275	Drywall Board	Friable	Intact
2273, 2276	Drywall Composite	Friable	Intact
2277, 2278	White Interior Caulk	Non-Friable	Intact
2279, 2280	Cove Base	Non-Friable	Intact
2281, 2282, 2283, 2284, 2285	Ceiling Texture	Friable	Intact
2286, 2287	Vibration Joint	Friable	Intact
2292, 2293, 2294, 2295, 2296, 2297, 2298	Rough Texture on Drywall	Friable	Intact
2923, 2924	Exterior Caulk	Non-Friable	Intact
Building 27 – 2040 – A, B, C, D			
2302, 2395	Drywall Board	Friable	Intact
2303, 2306	Drywall Composite	Friable	Intact
2307, 2308	White Interior Caulk	Non-Friable	Intact
2309, 2310	Cove Base	Non-Friable	Intact
2311, 2313, 2314, 2315	Ceiling Texture	Friable	Intact
2316, 2317	Vibration Joint	Friable	Intact
2322, 2323, 2324, 2325, 2326, 2327, 2328	Rough Texture on Drywall	Friable	Intact
2925, 2926	Exterior Caulk	Non-Friable	Intact

Building 28 – 2050, 2052, 2054, 2056			
2332, 2335	Drywall Board	Friable	Intact
2333, 2336	Drywall Composite	Friable	Intact
2337, 2338	White Interior Caulk	Non-Friable	Intact
2330, 2340	Cove Base	Non-Friable	Intact
2341, 2342, 2343, 2344, 2345	Ceiling Texture	Friable	Intact
2346, 2347	Vibration Joint	Friable	Intact
2352, 2353, 2354, 2355, 2356, 2357, 2358	Rough Texture on Drywall	Friable	Intact
Building 29 – 2058 – A, B, C, D			
2362, 2365	Drywall Board	Friable	Intact
2363, 2366	Drywall Composite	Friable	Intact
2367, 2368	White Interior Caulk	Non-Friable	Intact
2369, 2370	Cove Base	Non-Friable	Intact
2371, 2372, 2374, 2375	Ceiling Texture	Friable	Intact
2376, 2377	Vibration Joint	Friable	Intact
2382, 2383, 2384, 2385, 2386, 2387, 2388	Rough Texture on Drywall	Friable	Intact
2929, 2930	Exterior Caulk	Non-Friable	Intact

Building 30 – 2060 – A, B, C, D			
2392, 2395	Drywall Board	Friable	Intact
2393, 2396	Drywall Composite	Friable	Intact
2397, 2398	White Interior Caulk	Non-Friable	Intact
2399, 2400	Cove Base	Non-Friable	Intact
2401, 2402, 2403, 2404, 2405	Ceiling Texture	Friable	Intact
2406, 2407	Vibration Joint	Friable	Intact
Building 31 – 2062 – A, B, C, D			
2422, 2425	Drywall Board	Friable	Intact
2427, 2428	White Interior Caulk	Non-Friable	Intact
2429, 2430	Brown Cove Base	Non-Friable	Intact
2431, 2432, 2433, 2434, 2435	Ceiling Texture	Friable	Intact
2442, 2443, 2444	Gray Blow-In Insulation	Friable	Intact
Building 32 – 2064, 2066, 2068, 2070			
2452, 2455	Drywall Board	Friable	Intact
2457, 2458	White Interior Caulk	Non-Friable	Intact
2459, 2460	Cove Base	Non-Friable	Intact
2461, 2462, 2463, 2464, 2465	Ceiling Texture	Friable	Intact
2470, 2472	Paper Wrap on Duct	Friable	Intact

Building 33 – 2078 – A, B, C, D			
2482, 2485	Drywall Board	Friable	Intact
2483, 2486	Drywall Composite	Friable	Intact
2487, 2488	White Interior Caulk	Non-Friable	Intact
2489, 2490	Brown Cove Base	Non-Friable	Intact
2491, 2492, 2493, 2494, 2495	Ceiling Texture	Friable	Intact
2496, 2497	Vibration Joint	Friable	Intact
1529, 1530	Brown Blow-In Insulation	Friable	Intact
Building 34 – 2082 – A, B, C, D			
2512, 2515	Drywall Board	Friable	Intact
2513, 1526	Drywall Composite	Friable	Intact
2517, 2518	White Interior Caulk	Non-Friable	Intact
2519, 2520	Cove Base	Non-Friable	Intact
2521, 2522, 2523, 2524, 2525	Ceiling Texture	Friable	Intact
2526, 2527	Vibration Joint	Friable	Intact
2532, 2533, 2534, 2535, 2536, 2537, 2538	Rough Texture on Drywall	Friable	Intact
Building 35 – 2084 – A, B, C, D			
2542, 2545	Drywall Board	Friable	Intact
2547, 2548	White Interior Caulk	Non-Friable	Intact
2549, 2550	Cove Base	Non-Friable	Intact
2551, 2552, 2553, 2554, 2155	Ceiling Texture	Friable	Intact
2556, 2557	Vibration Joint	Friable	Intact
2562, 2563, 2564, 2565, 2566, 2567, 2568	Rough Texture on Wall	Friable	Intact

Building 36 – 2086 – A, B, C, D			
2572, 2575	Drywall Board	Friable	Intact
2573, 2576	Drywall Composite	Friable	Intact
2577, 2588	White Interior Caulk	Non-Friable	Intact
2579, 2580	Cove Base	Non-Friable	Intact
2581, 2582, 2583, 2584, 2485	Ceiling Texture	Friable	Intact
2586, 2587	Vibration Joint	Friable	Intact
2592, 2593, 2594, 2595, 2596, 2597, 2598	Rough Texture on Drywall	Friable	Intact
2599, 2600	Gray Blow-In Insulation	Friable	Intact
Building 37– 2090, 2092, 2094, 2096			
2602, 2605	Drywall Board	Friable	Intact
2603, 2606	Drywall Composite	Friable	Intact
2607, 2608	White Interior Caulk	Non-Friable	Intact
2609, 2620	Cove Base	Non-Friable	Intact
2611, 2612, 2613, 2614, 2615	Ceiling Texture	Friable	Intact
2616, 2617	Vibration Joint	Friable	Intact
2622, 2623, 2624, 2625, 2626, 2628	Rough Texture on Drywall	Friable	Intact

Building 38 – 2100 – A, B, C, D			
2632, 2635	Drywall Board	Friable	Intact
2633, 2636	Drywall Composite	Friable	Intact
2637, 2638	White Interior Caulk	Non-Friable	Intact
2639, 2640	Cove Base	Non-Friable	Intact
2641, 2642, 2643, 2644, 2645	Ceiling Texture	Friable	Intact
2646, 2647	Vibration Joint	Friable	Intact
2652, 2653, 2654, 2655, 2656, 2657, 2658	Rough Texture on Drywall	Friable	Intact
Building 39 – 2102 – A, C, D Laundry			
2662, 2665	Drywall Board	Friable	Intact
2663, 2666	Drywall Composite	Friable	Intact
2667, 2668	White Interior Caulk	Non-Friable	Intact
2669, 2670	Cove Base	Non-Friable	Intact
2671, 2672, 2673, 2674, 2675	Ceiling Texture	Friable	Intact
2676, 2677	Vibration Joint	Friable	Intact
2682, 2683, 2684, 2685, 2686, 2687, 2687	Rough Texture on Drywall	Friable	Intact
2689, 2690	Gray Blow-In Insulation	Friable	Intact
2691, 2692	Brown Blow-In Insulation	Friable	Intact

Building 40 – 2104 – A, B, C, D			
2702, 2705	Drywall Board	Friable	Intact
2703, 2706	Drywall Composite	Friable	Intact
2707, 2708	White Interior Caulk	Non-Friable	Intact
2709, 2710	Cove Base	Non-Friable	Intact
2711, 2712, 2713, 2714, 2715	Ceiling Texture	Friable	Intact
2716, 2717	Vibration Joint	Friable	Intact

2856, 2857	Vibration Joint	Friable	Intact
2863, 2863, 2864, 2865, 2867, 2868	Rough Texture on Drywall	Friable	Intact
2869, 2870	Brown Blow-In Insulation	Friable	Intact
Old Office Building			
2842, 2845	Drywall Board	Friable	Intact
2843, 2846	Drywall Composite	Friable	Intact
2847, 2848	White Interior Caulk	Non-Friable	Intact
2849, 2850	Cove Base	Non-Friable	Intact
2851, 2852, 2853, 2854, 2855	Ceiling Texture	Friable	Intact
2856, 2857	Vibration Joint	Friable	Intact
2863, 2863, 2864, 2865, 2867, 2868	Rough Texture on Drywall	Friable	Intact
2869, 2870	Brown Blow-In Insulation	Friable	Intact

4. Conclusions and Recommendations

On May 22 through June 16, 2023, Bureau Veritas completed this Asbestos Inspection of Nelson Park Apartments (the "Project"), located at 1994 Maryland Avenue in Columbus, Ohio. A total of one thousand five hundred six (1,506) bulk samples with laboratory analysis of bulk samples showing asbestos to be present (>1% by weight) in one hundred seventy-two (172) samples. <1% Asbestos was detected in eight (8) materials.

Bulk samples were collected and analyzed to facilitate the inspection.

The following were identified as friable asbestos-containing materials identified on the property:

- Paper wrap on duct
- Drywall tape and compound
- Vibration Joint
- Paper tape on duct
- Rough texture on drywall
- Drywall composite

The following were identified as non-friable asbestos-containing materials identified on the property:

- Cove Base
- Exterior caulk

The following were identified to contain less than one percent asbestos:

- Drywall composite
- Rough texture on drywall

The remaining materials were found to have no asbestos detected by laboratory analysis via PLM.

4.1. Recommendations

Bureau Veritas offers the following recommendations:

- If any ACMs are friable or will be disturbed as a result of renovation or demolition activities they should be removed by a State of Ohio certified asbestos abatement contractor prior to disturbance. Any such abatement projects should be monitored by a qualified industrial hygiene firm for worker and environmental safety.
- Any ACMs that will not be disturbed should be managed in place using an O&M Program. This should include, at a minimum repair of damaged ACM's. As part of an O&M Program any contractors bidding on or performing work in the area should be made aware of the presence and locations of ACM's.
- Any repair and maintenance activities where the ACM is going to be disturbed and may release fibers must be performed by personnel with a minimum of 16-hour OSHA Class III training. Any maintenance or custodial activities where ACM may be contacted but will not likely be disturbed should be performed by personnel with a minimum of 2 hour OSHA Class IV training. All training should comply with 29 CFR 1926.1101(k)(9)(vi)

Layer 1: Fibrous Material					
Not analyzed due to positive stop instructions.					
517942-005	05/22/23	23MR-1435	Bldg 1 500 To 506		
Layer 1: Fibrous Material					
Not analyzed due to positive stop instructions.					
517942-006	05/22/23	23MR-1436	Bldg 1 500 To 506		
Layer 1: Fibrous Material Gray, Fibrous				40% CHRYSOTILE	40% CELLULOSE FIBER 20% NON FIBROUS MATERIAL

Reporting Limit: 1% Gravimetrically Reduced Reporting Limit: 0.01% PLM analysis is based on Visual Estimation and NESHAP recommends that any friable sample with an asbestos content less than 10 percent be verified by Point Count or TEM Analysis. The EPA recommends that any attic loose fill vermiculite should be treated as asbestos containing material. This report must not be reproduced except in full with the approval of the laboratory. The test results apply to the sample as received.
